## Contents

1 License .......................................................... 1

2 Supported Operating Systems, Versions and Architectures ............... 5

3 Supported and Tested Docker Versions .................................. 7
   3.1 Known Docker Issues That Affect Univa Grid Engine ................. 12

4 Fixes and Enhancements .................................................. 13
   4.1 Major Enhancements .................................................. 13
      4.1.1 (IMPORTANT) UGE Product Parts and Features Declared as Deprecated 13
      4.1.2 (UGE 8.6.11) Resolving additional groupd id's and definable ranges .. 13
      4.1.3 (UGE 8.6.8) Possibility to disable qinstance access checks during submission .................................................. 13
      4.1.4 (UGE 8.6.8) New Scheduler Parameters for Tuning Wildcard PE Scheduling 14
      4.1.5 (UGE 8.6.8) New PE_SORT_ORDER to Improve Scheduling Time ....... 14
      4.1.6 (UGE 8.6.8) Support for Linux Mount Namespace .................. 14
      4.1.7 (UGE 8.6.8) Rework of profiling for all threads and execution daemon . 15
      4.1.8 (UGE 8.6.8) GPU Usage of Jobs Reported by DCGM .................. 15
      4.1.9 (UGE 8.6.8) Automatically Adding All Job Owners Supplementary Group IDs to a Docker Job .................................................. 17
      4.1.10 (UGE 8.6.7) DRMAA2 Related Changes and Enhancements .......... 17
      4.1.11 (UGE 8.6.7) Official Red Hat 8 Support ........................ 17
      4.1.12 (UGE 8.6.5) Support for Linux Mount Namespace (obsoleted, see above under UGE 8.6.8) .................................................. 18
      4.1.13 (UGE 8.6.3) Bulk Changes for Exec Hosts and Projects ........... 18
      4.1.14 New Core Binding Strategies and PE Behavior .................... 19
      4.1.15 Affinity Based Job Placement .................................... 19
      4.1.16 Managing Access to Devices with RSMAPs .......................... 20
      4.1.17 Integration with Nvidia DCGM .................................... 20
      4.1.18 Performance Improvements ....................................... 21
      4.1.19 Reworked Dispatch Job Information ................................ 22
      4.1.20 Data Compression at Communication Layer ........................ 22
      4.1.21 Using RSMAPs with Topology Masks and XOR Operator .......... 23
## Other

4.2 | JSV Improvements | 25  
---|---|---  
4.2.1 | Reduce qhost Data Request Sizes at sge_qmaster | 25  
4.2.2 | Upgrade Advance and Standing Reservations | 25  
4.2.3 | Support for nvidia-docker 2.0 | 25  
4.2.4 | per_pe_task_prolog and per_pe_task_epilog | 25  
4.2.5 | The Master Task of a Parallel Docker Job in a Container | 26  
4.2.6 | Run the Container as root, Allow to Run Prolog etc. as a Different User | 26  
4.2.7 | Automatically Map User ID and Group ID of a User Into the Container | 26  
4.2.8 | Create a container_pe_hostfile with all Container Hostnames | 26  
4.2.9 | Docker Daemon Response Timeout | 27  
4.2.10 | Cgroups and Containers | 27  
4.2.11 | Specify Arguments to Autostart Docker Jobs | 28  
4.2.12 | New Client Command qralter | 28  
4.2.13 | Changes to the loadcheck Command | 28  
4.2.14 | Changed startup behaviour of the execution daemon | 28  
4.2.15 | Forwarding the environment for a qrsh (without command) and qlogin job is enabled | 29  
4.2.16 | Suppress the user switch inside Docker jobs | 29  
4.2.17 | Allow to skip Docker image check in execution daemon | 29  
4.2.18 | New values for initial_state of a queue | 29  
4.2.19 | Removed reporting of m_mem_free_nx load values | 29  
4.2.20 | GPU Affinity as Soft Request | 30  
4.2.21 | Trigger command to force re-read of host_aliases file | 30  
4.2.22 | Automatically set jobs to hold state if they trigger errors | 30  
4.2.23 | Switch off submit host verification | 30  
4.2.24 | Log daemon startup errors to syslog | 30  
4.2.25 | Enabled monitoring and deadlock detection feature for all platforms | 31  
4.2.26 | sub-cgroup feature | 31  
4.2.27 | Removing stale “context” entries in queue | 31  
4.2.28 | Cleanup of output file path handling | 31  
4.2.29 | New logging option for hostname or ip lookup calls | 32  
4.2.30 | Full List of Fixes and Enhancements | 33
4.3.1 8.6.0 (and Also Fixed for a 8.5.*, 8.4.*, 8.3.* Patch Release) ....... 33
4.3.2 8.6.0 (and Also Fixed for a 8.5.* and 8.4.* Patch Release) ....... 33
4.3.3 8.6.0 (and Also Fixed for a 8.5.* Patch Release) .............. 34
4.3.4 8.6.0 .................................................. 38
4.3.5 8.6.1 .................................................. 44
4.3.6 8.6.2 .................................................. 44
4.3.7 8.6.3 .................................................. 44
4.3.8 8.6.4 .................................................. 45
4.3.9 8.6.5 prealpha_devbuild_1 ................................... 46
4.3.10 8.6.5 prealpha_devbuild_2 .................................. 48
4.3.11 8.6.5 prealpha_devbuild_3 .................................. 49
4.3.12 8.6.5 alpha_1 .......................................... 49
4.3.13 8.6.5 alpha_2 .......................................... 50
4.3.14 8.6.5 .................................................. 50
4.3.15 8.6.6 .................................................. 50
4.3.16 8.6.7 alpha_1 .......................................... 51
4.3.17 8.6.7 .................................................. 52
4.3.18 8.6.8 prealpha_devbuild_1 .................................. 52
4.3.19 8.6.8 .................................................. 53
4.3.20 8.6.9 .................................................. 55
4.3.21 8.6.10 .................................................. 55
4.3.22 8.6.11 .................................................. 55
4.3.23 8.6.12 .................................................. 57

5 Upgrade Notes ............................................. 58
5.1 Upgrade Requirements ........................................ 58

6 Compatibility Notes ........................................ 59
6.1 Changes in Windows Execution Host sgepasswd File .......... 59
6.2 Scheduler Log File ......................................... 59
6.3 Removed Scheduler-Parameter queue_sort_method ............ 59
6.4 Changes for qconf Exit States ................................. 60
6.5 Changes for Scheduler Profiling ................................ 60
6.6 Changed Limit Calculations .................................. 60
6.7 New Default for Job Verification of DRMAA Submitted Jobs .............. 61
6.8 Default for Integer Complexes ........................................... 61
6.9 Deprecated Functionality .................................................. 62
6.10 Removed Functionality ...................................................... 62
6.11 Changed UGERest configuration location ............................. 62
6.12 Changed UGERest restlet framework ................................. 62

7 Known Issues and Limitations ............................................... 62
1 License

TERM SOFTWARE LICENSE AGREEMENT

This agreement is between the individual or entity agreeing to this agreement and Univa Corporation, a Delaware corporation (Univa) with its registered office at 2300 N Barrington Road, Suite 400, Hoffman Estates, IL 60195.

1. SCOPE

This agreement governs the licensing of the Univa Software and Support provided to Customer.

- Univa Software means the Univa software described in the order, all updates and enhancements provided under Support, its software documentation, and license keys (Univa Software), which are licensed under this agreement. This Univa Software is only licensed and is not sold to Company.
- Third-Party Software/Open Source Software licensing terms are addressed on the bottom of this agreement.

2. LICENSE

Subject to the other terms of this agreement, Univa grants Customer, under an order, a non-exclusive, non-transferable, renewable term license up to the license capacity purchased to: (a) Operate the Univa Software in Customer’s business operations; and (b) Make a reasonable number of copies of the Univa Software for archival and backup purposes. Customer’s contractors and majority owned affiliates are allowed to use and access the Univa Software under the terms of this agreement. Customer is responsible for their compliance with the terms of this agreement. The initial contracted term of this license will be automatically renewed on its expiry for a one year period unless a written notification of termination has been received 60 days prior to term expiry.

3. RESTRICTIONS

Univa reserves all rights not expressly granted. Customer is prohibited from: (a) assigning, sublicensing, or renting the Univa Software or using it as any type of software service provider or outsourcing environment; or (b) causing or permitting the reverse engineering (except to the extent expressly permitted by applicable law despite this limitation), decompiling, disassembly, modification, translation, attempting to discover the source code of the Univa Software or to create derivative works from the Univa Software.

4. PROPRIETARY RIGHTSAND CONFIDENTIALITY

(a) Proprietary Rights. The Univa Software, workflow processes, designs, know-how and other technologies provided by Univa as part of the Univa Software are the proprietary property of Univa and its licensors, and all right, title and interest in and to such items,
including all associated intellectual property rights, remain only with Univa. The Univa Software is protected by applicable copyright, trade secret, and other intellectual property laws. Customer may not remove any product identification, copyright, trademark or other notice from the Univa Software.

(b) Confidentiality. Recipient may not disclose Confidential Information of Discloser to any third party or use the Confidential Information in violation of this agreement.

(c) Confidential Information means all proprietary or confidential information that is disclosed to the recipient (Recipient) by the discloser (Discloser), and includes, among other things:

- any and all information relating to Univa Software or Support provided by a Discloser, its financial information, software code, flow charts, techniques, specifications, development and marketing plans, strategies, and forecasts;
- as to Univa the Univa Software and the terms of this agreement (including without limitation, pricing information).

(ii) Confidential Information excludes information that:

- was rightfully in Recipient's possession without any obligation of confidentiality before receipt from the Discloser;
- is or becomes a matter of public knowledge through no fault of Recipient;
- is rightfully received by Recipient from a third party without violation of a duty of confidentiality;
- is independently developed by or for Recipient without use or access to the Confidential Information; or is licensed under an open source license. Customer acknowledges that any misuse or threatened misuse of the Univa Software may cause immediately irreparable harm to Univa for which there is no adequate remedy at law. Univa may seek immediate injunctive relief in such event.

5. PAYMENT

Customer will pay all fees due under an order within 30 days of the invoice date, plus applicable sales, use and other similar taxes.

6. WARRANTY DISCLAIMER. UNIVA DISCLAIMS ALL EXPRESS AND IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION THE IMPLIED WARRANTY OF TITLE, MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE UNIVA SOFTWARE MAY NOT BE ERROR FREE, AND USE MAY BE INTERRUPTED.

7. TERMINATION

Either party may terminate this agreement upon a material breach of the other party after a 30 days notice/cure period, if the breach is not cured during such time period. Upon termination of this agreement or expiration of an order, Customer must discontinue using the Univa Software, de-install it and destroy or return the Univa Software and all copies, within 5 days. Upon Univa’ request, Customer will provide written certification of such compliance.
8. SUPPORT INCLUDED

Univa's technical support and maintenance services (Support) is included with the fees paid under an order. Univa may change its Support terms, but Support will not materially degrade during any paid term. More details on Support are located at www.univa.com/support

9. LIMITATION OF LIABILITY AND DISCLAIMER OF DAMAGES

There may be situations in which, as a result of material breach or other liability, Customer is entitled to make a claim for damages against Univa. In each situation (regardless of the form of the legal action (e.g. contract or tort claims)), Univa is not responsible beyond: (a) the amount of any direct damages up to the amount paid by Customer to Univa in the prior 12 months under this agreement; and (b) damages for bodily injury (including death), and physical damage to tangible property, to the extent caused by the gross negligence or willful misconduct of Univa employees while at Customer's facility. Other than for breach of the Confidentiality section by a party, the infringement indemnity, violation of Univa's intellectual property rights by Customer, or for breach of Section 2 by Customer, in no circumstances is either party responsible for any (even if it knows of the possibility of such damage or loss): (a) loss of (including any loss of use), or damage to: data, information or hardware; (b) lost profits, business, or goodwill; or (c) other special, consequential, or indirect damages

10. INTELLECTUAL PROPERTY INDEMNITY

If a third-party claims that Customer's use of the Univa Software under the terms of this agreement infringes that party's patent, copyright or other proprietary right, Univa will defend Customer against that claim at Univa' expense and pay all costs, damages, and attorney's fees, that a court finally awards or that are included in a settlement approved by Univa, provided that Customer: (a) promptly notifies Univa in writing of the claim; and (b) allows Univa to control, and cooperates with Univa in, the defense and any related settlement. If such a claim is made, Univa could continue to enable Customer to use the Univa Software or to modify it. If Univa determines that these alternatives are not reasonably available, Univa may terminate the license to the Univa Software and refund any unused fees. Univa' obligations above do not apply if the infringement claim is based on the use of the Univa Software in combination with products not supplied or approved by Univa in writing or in the Univa Software, or Customer's failure to use any updates within a reasonable time after such updates are made available. This section contains Customer's exclusive remedies and Univa' sole liability for infringement claims.

11. GOVERNING LAW AND EXCLUSIVE FORUM

This agreement is governed by the laws of the State of Illinois, without regard to conflict of law principles. Any dispute arising out of or related to this agreement may only be brought in the state of Illinois. Customer consents to the personal jurisdiction of such courts and waives any claim that it is an inconvenient forum. The prevailing party in litigation is entitled to recover its attorneys' fees and costs from the other party.

12. MISCELLANEOUS
(a) Inspection. Upon request by Univa, Customer must provide a usage report at least 60 days before the renewal anniversary. Univa, or its representative, may audit Customer’s usage of the Univa Software at any Customer facility. Customer will cooperate with such audit. Customer agrees to pay within 30 days of written notification any fees applicable to Customer’s use of the Univa Software in excess of the license.

(b) Entire Agreement. This agreement, and all orders, constitute the entire agreement between the parties, and supersedes all prior or contemporaneous negotiations, representations or agreements, whether oral or written, related to this subject matter.

(c) Modification Only in Writing. No modification or waiver of any term of this agreement is effective unless signed by both parties.

(d) Non-Assignment. Neither party may assign or transfer this agreement to a third party, except that the agreement and all orders may be assigned upon notice as part of a merger, or sale of all or substantially all of the business or assets, of a party.

(e) Export Compliance. Customer must comply with all applicable export control laws of the United States, foreign jurisdictions and other applicable laws and regulations.

(f) US Government Restricted Rights. The Univa Software is provided with RESTRICTED RIGHTS. Use, duplication, or disclosure by the U.S. government or any agency thereof is subject to restrictions as set forth in subparagraph (c)(1)(ii) of the Rights in Technical Data and Computer Software clause at DFARS 252.227-7013 or subparagraphs (c)(1) and (2) of the Commercial Computer Software Restricted Rights at 48 C.F.R. 52.227-19, as applicable.

(g) Independent Contractors. The parties are independent contractors with respect to each other.

(h) Enforceability. If any term of this agreement is invalid or unenforceable, the other terms remain in effect.

(i) No PO Terms. Univa rejects additional or conflicting terms of a Customer’s form-purchasing document.

(k) Survival. All terms that by their nature survive termination or expiration of this agreement, will survive.

Additional software specific licensing terms: Grid Engine and Univa Software incorporate certain third-party software listed at the URL below. These licenses are accepted by use of the software and may represent license grants with restrictions which Univa is bound to provide. We are hereby notifying you of these licenses. * Third Party Software means certain third-party software which is provided along with the Univa Software, and such software is licensed under the license terms located at: http://www.univa.com/resources/licenses/

* Open Source Software means certain open source software which is provided along with the Univa Software, and such software is licensed under the license terms located at: http://www.univa.com/resources/licenses/

<tr>
<td>Microsoft Windows</td>
<td>10 Pro / Enterprise</td>
<td>32 and 64bit</td>
</tr>
</tbody>
</table>

Table 1: Supported Operating Systems, Versions and Architectures
PLEASE NOTE: Hosts running the Microsoft Windows operating system cannot be used as master or shadow hosts.

PLEASE NOTE: Univa Grid Engine qmaster is fully supported on Linux and Solaris. We provide binaries in Univa Grid Engine for running the qmaster on other operating systems but they are not supported and delivered as a courtesy. If you require qmaster support on other architectures please contact us at support@univa.com.

PLEASE NOTE: if you require Univa Grid Engine support for older versions of the above operating systems please contact our sales or support team.
3  Supported and Tested Docker Versions

In principle, Univa Grid Engine supports these Docker versions on these Linux distributions:

<table>
<thead>
<tr>
<th>Linux Distribution</th>
<th>Docker versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>RedHat, CentOS, Debian and Ubuntu</td>
<td>1.12.0 to 1.13.0 and</td>
</tr>
<tr>
<td></td>
<td>17.03.0-ce to 19.03.1-ce</td>
</tr>
<tr>
<td>SLES and openSUSE</td>
<td>1.12.0 to 1.13.0 and</td>
</tr>
<tr>
<td></td>
<td>17.03.0-ce to 19.03.1-ce</td>
</tr>
</tbody>
</table>

But in the past some Docker versions did not work properly and were withdrawn later. There were different Docker builds provided under the same version number showing a slightly different behavior, so it is not possible to ensure Univa Grid Engine does work with all Docker versions between 1.12.0 and 19.03.1. The following table shows which Docker versions were tested on which Linux distribution. The table includes the “Git commit” ID of the Docker source code, the Go language version which was used to build Docker, the build date and - for completeness - the version of the Docker Remote API. Other Docker versions were not tested or are too broken to test successfully.

- Red Hat Enterprise Linux 7.4 (Maipo), Kernel 3.10.0-693.11.1.el7.x86_64

3.1 Known Docker Issues That Affect Univa Grid Engine

- With Docker 17.09.0-ce and Docker 17.12.0-ce, specifying the `--oom-kill-disable` switch has no effect, when using the `docker` command line client nor the `-xd --oom-kill-disable` switch of the Univa Grid Engine submit clients.
4 Fixes and Enhancements

4.1 Major Enhancements

4.1.1 (IMPORTANT) UGE Product Parts and Features Declared as Deprecated

- Support for Java and TCL Job Submission Verifiers will be dropped and corresponding scripts will be removed from the product packages beginning with 8.7. Bourne Shell, Python and Perl JSVs will be available and fully supported. Examples for corresponding JSV scripts can be found in $SGE_ROOT/util/resources/jsv.

- The Hadoop package will not be part of the UGE distribution beginning with 8.7.

Please note that all mentioned product parts and features are still available with this patch release and will also be available for future patch releases of 8.6.

4.1.2 (UGE 8.6.11) Resolving additional group id’s and definable ranges

Univa Grid Engine 8.6.11 introduces the following new features to optimize performance that allow to reduce the load on configured user/group resolving mechanisms like NIS/LDAP/Active Directory/...:

UGE clients which do not require supplementary group ids, will never resolve them and never send them to qmaster. Following is the list of clients which do not require them: qstat, qrstat, qhost, qacct, qquota, qevent, sge_passwd, lostat, loacct, and loquota.

A new environment variable, SGE_SUP_GRP_EVAL=0 is introduced which suppresses sending to qmaster, and thereby not resolving of supplementary groups for all UGE clients.

A new execd_param, SUP_GRP_EVAL=0 results in writing environment variable SGE_SUP_GRP_EVAL=0 for the shepherd. When set to -1 (default), qmaster_params ENABLE_SUP_GRP_EVAL=FALSE takes precedence of writing SGE_SUP_GRP_EVAL=0 to the environment file. No environment variable will be written if ENABLE_SUP_GRP_EVAL=TRUE.

A new environment variable, SGEDISABLE_SUP_GRP_EVAL_RANGE=<range> is introduced, where <range> can be any normal or open-ended gid range. These gids won't be sent to the qmaster. To reduce resolving overhead of unresolvable addgrpid for UGE commands issued within UGE job, execd always writes addgrpid to shepherds environment file. For open-ended ranges, the max value considered is 9,999,999.

A new execd_param, DISABLE_SUB_GRP_EVAL=<range> is introduced which combines addgrpid and the provided range, writing them to the shepherds environment file as SGEDISABLE_SUB_GRP_EVAL_RANGE.

4.1.3 (UGE 8.6.8) Possibility to disable qinstance access checks during submission

If a user tries to submit a job into a cluster that either has no qinstances defined (cluster queue exists but host list or referenced host groups are empty) or where the submitting user has no access to any of the existing queue instances then that job is automatically rejected. To disable this behaviour the qmaster_param named DISABLE_QINSTANCE_CHECK can be set to true or 1.
4.1.4  **(UGE 8.6.8) New Scheduler Parameters for Tuning Wildcard PE Scheduling**

Three new scheduler parameters have been added for tuning the scheduling of jobs with wildcard PE requests. Without special tuning the scheduler will always try to find the best matching resource assignment. For example, the PE providing most slots of a PE range request, the assignment with most soft requests being granted or the reservation with the earliest job start time. Therefore the scheduling algorithm will go over all possible matching PEs and try to find the best one which can result in high scheduling times.

The following parameters can be used to define that possible but not optimal scheduling results will be accepted which can significantly reduce scheduling times (see also sched_conf.5):

- **PE_ACCEPT_FIRST_ASSIGNMENT**: The first valid assignment or reservation will be used. This parameter is best combined with PE_SORT_ORDER=CAPACITY, see below.
- **PE_ACCEPT_ASSIGNMENT_TIME**: When an assignment has been found the search for better resources will be stopped after the time specified by PE_ACCEPT_ASSIGNMENT_TIME.
- **PE_ACCEPT_SOFT_VIOLATIONS**: The scheduling algorithm will stop searching for better resources when the assignment found so far has not more than the specified number of soft violations (number of soft requests which cannot be granted).

4.1.5  **(UGE 8.6.8) New PE_SORT_ORDER to Improve Scheduling Time**

The new value CAPACITY is available for the scheduler parameter PE_SORT_ORDER.

When it is set, the parallel environment list is sorted before dispatching/reservation scheduling of every parallel job:

- for dispatching the parallel environment list is sorted by free slots descending.
- for reservation scheduling the parallel environment list is sorted by the time of the last entry in the resource diagram ascending. This is the time where reservation scheduling can be guaranteed.

PE_SORT_ORDER=CAPACITY is best combined with PE_ACCEPT_FIRST_ASSIGNMENT=TRUE and can have significant performance impact for specific scenarios.

4.1.6  **(UGE 8.6.8) Support for Linux Mount Namespace**

Starting with Univa Grid Engine 8.6.8, it is possible to make use of Linux mount namespaces in the following way:

- create a base tmpdir
- create a hostgroup containing the Linux hosts that support Linux mount namespaces (unshare() system call)
- create a queue that defines a common base tmpdir using the Linux mount namespace syntax extension (see queue_conf.5)
• run a corresponding test job

A possible test job script can be found under $SGE_ROOT/util/resources/Ins/mytestscript.sh. In the job output file you can verify the corresponding bind mount and mount namespace settings of the job.

### 4.1.7 (UGE 8.6.8) Rework of profiling for all threads and execution daemon

The profiling functionality for threads in `sge\_qmaster(8)` and `sge\_execd(8)` has been revised. It is now possible to set an output time by using the newly introduced `PROF_TIME` configuration parameter. It is also possible to enable profiling for the reader threads with `PROF_READER` configuration parameter. More information can be found in `sge_conf(5)` man page. The profiling output now also contains the proportion of the level specific wall clock time on the total wall clock time (see also `sge_diagnostics(5)` man page).

### 4.1.8 (UGE 8.6.8) GPU Usage of Jobs Reported by DCGM

With UGE 8.6.8 GPU usage reporting can be enabled for Nvidia GPUs. Prerequisite is that the nv-hostengine is running on the execution host and communication between `sge_execd` and the nv-hostengine is enabled by configuring the `execd_param UGE_DCGM_PORT` in the global or local configuration, see man page `sge_conf(5)`. Once `UGE_DCGM_PORT` is set GPU specific load values are reported by `sge_execd`, see Integration with Nvidia DCGM. Per Job usage can be enabled by adding the `execd_param ENABLE_DCGM_JOB_USAGE=TRUE`. By default it is disabled.

The following usage values can be reported per GPU and be part of the usage output of `qstat -j job_id`:

<table>
<thead>
<tr>
<th>usage value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cuda.&lt;gpu&gt;.boardLimitViolationTime</code></td>
<td>Amount of seconds we were at reduced clocks due to being at the board's max voltage</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.eccDoubleBit</code></td>
<td>Count of ECC double bit errors that occurred</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.eccSingleBit</code></td>
<td>Count of ECC single bit errors that occurred</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.energyConsumed</code></td>
<td>Energy consumed by the gpu in Joules</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.lowUtilizationTime</code></td>
<td>Amount of seconds we were at reduced clocks due to low utilization</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.maxGpuMemoryUsed</code></td>
<td>Maximum amount of GPU memory that was used in MB</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.memoryClock_min</code></td>
<td>minimum Memory clock in MHz</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.memoryClock_max</code></td>
<td>maximum Memory clock in MHz</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.memoryClock_avg</code></td>
<td>average Memory clock in MHz</td>
</tr>
<tr>
<td><code>cuda.&lt;gpu&gt;.memoryUtilization_min</code></td>
<td>minimum GPU Memory Utilization in percent</td>

<tr>
<td>cuda.&lt;gpu&gt;.smUtilization_avg</td>
<td>average GPU SM Utilization in percent</td>
</tr>
<tr>
<td>cuda.&lt;gpu&gt;.syncBoostTime</td>
<td>Amount of seconds we were at reduced clocks due to sync boost</td>
</tr>
<tr>
<td>cuda.&lt;gpu&gt;.thermalViolationTime</td>
<td>Number of seconds we were at reduced clocks due to thermal violation</td>
</tr>
</tbody>
</table>

Which values to report is defined via the global/local configuration attribute `gpu_job_usage`. The following values can be configured, default is `none`. 

*Grid Engine Release Notes v 8.6.12*
## 4.1.9 (UGE 8.6.8) Automatically Adding All Job Owners Supplementary Group IDs to a Docker Job

Using the special keyword `SGE_SUP_GRP_EVAL` with the `-group-add` option of the `-xd` switch during job submission allows to automatically add all supplementary groups to the group list of the job user inside of the Docker container. Additional group IDs can be specified by using the `-group-add` option several times.

E.g.:

```bash
# qsub -l docker,docker_images="*some_image*",-xd "-group-add SGE_SUP_GRP_EVAL,-group-add 789" ...
```

makes Univa Grid Engine add all additional group IDs of the job owner on the execution host as well as the group id 789.

## 4.1.10 (UGE 8.6.7) DRMAA2 Related Changes and Enhancements

With UGE 8.6.7 DRMAA2 reflects the failed reason field that is also visible in qacct. To get this information the implementation specific attribute uge_ji_failed has to be requested via jobinfo.

## 4.1.11 (UGE 8.6.7) Official Red Hat 8 Support

Univa Grid Engine supports Red Hat Enterprise Linux 8. However, Red Hat Enterprise Linux 8 does not officially support Docker, but Docker CE can be installed using the official repository for Cent OS 7:

Install `yum-config-manager` and add the docker-ce repository:

```bash
$ sudo yum install yum-utils
$ sudo yum-config-manager --add-repo
    https://download.docker.com/linux/centos/docker-ce.repo
```

Once the repository is added, `yum list docker-ce` lists the available Docker CE versions:

```bash
$ yum list docker-ce --showduplicates | sort -r
docker-ce.x86_64 3:18.09.2-3.el7   docker-ce-stable
docker-ce.x86_64 3:18.09.1-3.el7   docker-ce-stable
docker-ce.x86_64 3:18.09.0-3.el7   docker-ce-stable
...
```

<table>
<thead>
<tr>
<th>setting</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>no gpu usage values will be reported</td>
</tr>
<tr>
<td>all</td>
<td>all implemented usage values will be reported, see the table above</td>
</tr>
<tr>
<td>&lt;variable list&gt;</td>
<td>comma or space separated list of variable names, without <code>cuda.&lt;gpu&gt;</code></td>
</tr>
<tr>
<td></td>
<td>e.g. <code>eccDoubleBit, maxGpuMemoryUsed, memoryClock_max</code>...</td>
</tr>
</tbody>
</table>
Now Docker CE can be installed and enabled:

```
$ sudo yum install docker-ce
$ sudo systemctl enable --now docker
```

**4.1.12 (UGE 8.6.5) Support for Linux Mount Namespace (obsoleted, see above under UGE 8.6.8)**

Starting with Univa Grid Engine 8.6.5 it is possible to make use of Linux mount namespaces in prolog and epilog scripts in the following way:

- create a shared base tmpdir
- enable LINUX_MOUNT_NAMESPACE execd parameter.
- create a hostgroup containing the linux hosts that support Linux mount namespaces (unshare() system call)
- create a queue that defines a common base tmpdir, prolog and epilog and use the hostgroup defined above
- run a corresponding test job

Further setup information can be found in $SGE_ROOT/util/resources/Ins/README and examples for prolog, epilog and testing scripts are located there as well.

**4.1.13 (UGE 8.6.3) Bulk Changes for Exec Hosts and Projects**

Beginning with UGE 8.6.3 qconf as well as the config API will support bulk operations for the exec host and project object. Bulk operations allow to get, add, modify or delete multiple configuration objects with one UGE operation. Internal communication overhead for those operations will be reduced compared to multiple individual operations.

qconf now supports following additional switches:

- `qconf -seld [exechost_list]` shows a detailed list of all exec hosts or hosts in exechost_list
- `qconf -sprjld [project_list]` show a detailed list of all projects or projects in project_list
- `qconf -Ae dirname` adds exec hosts from every file in directory dirname
- `qconf -Me dirname` modifies exec hosts from every file in directory dirname
- `qconf -Aprj dirname` adds projects form every file in directory dirname
- `qconf -Mprj dirname` modifies projects from every file in directory dirname
4.1.14 New Core Binding Strategies and PE Behavior

For PE-jobs it is hard or even impossible to know in advance how many tasks are going to be scheduled and on how many hosts. Therefore, with Univa Grid Engine version 8.6.0, the core-binding request behavior has changed to accommodate this fact. The binding-request is now changed to a “per PE-task” request where previously it was a “per host” request. This means that the requested amount of cores for a PE-job are assigned “per PE-task”.

For example, if a job with

```bash
qsub -pe mype 5-7 -binding linear:2 -b y sleep 60
```

is submitted, it means that each PE-task will get 2 cores, no matter on which host or on how many hosts the tasks are scheduled.

There are now different binding-strategies, most of them exist in two versions: “host aware” and “host unaware” strategies. For example, there are two versions of linear binding strategies: linear and linear_per_task. Host unaware strategies have the suffix “_per_task”.

With “host aware” strategies, all tasks that end up on a host have to adhere to the given strategy together. For “host unaware” strategies, each task has to adhere to the strategy on its own. This is less strict and usually more tasks can fit on a host.

All available core binding strategies are:

- linear:<amount>[:<socket>,<core>]
- linear_per_task:<amount>
- striding:<amount>::<n>[:<socket>,<core>]
- striding_per_task:<amount>::<n>
- explicit:[<socket>,<core>;...]<socket>,<core>
- explicit_per_task:[<socket>,<core>;...]<socket>,<core>
- balance_sockets:<amount>
- pack_sockets:<amount>
- one_socket_balanced:<amount>
- one_socket_per_task:<amount>

See man page submit(5) for more details and examples.

4.1.15 Affinity Based Job Placement

Univa Grid Engine 8.6.0 adds an affinity job placement policy that allows assignment to each host or queue an affinity value for each consumed resource of jobs that are running on the host or queue.

Affinity can be positive or negative. Positive affinity will attract other pending jobs, negative affinity will reject other pending jobs. Attraction/rejection will work on host and/or queue level if this is enabled by setting the weighting parameters weight_host_affinity and/or weight_queue_affinity.

Sorting based on this affinity value will cause
• affinity (so that jobs are packed on clusters of hosts or queues),
• anti-affinity (so that jobs are distributed on hosts in the cluster or queues residing on hosts)
• or best fit (if a mixture of positive and negative affinity values is defined for different resources)

Find more information concerning job placement according to affinity values in the section 3.7.1 (Host/Queue Sorting) of the Admin Guide.

4.1.16 Managing Access to Devices with RSMAPs

Univa Grid Engine 8.6.0 allows to manage access to host devices via RSMAPs. Each id of a RSMAP complex can be configured to represent a device on the host by setting the new parameter “device”. Each device can be represented by more than one RSMAP id. In the example below a RSMAP complex gpu is initialized with two ids and each id is mapped to a Nvidia GPU:

```plaintext
complex_values   gpu=2(gpu0[device=/dev/nvidia0] gpu1[device=/dev/nvidia1])
```

The assigned devices are shown in the qstat output of a job:

```plaintext
  granted devices   host: /dev/nvidia0
```

In a default environment the configuration and assignment of devices has no effect on the scheduling, but if cgroups are available the cgroups parameter “devices” can be set to a list of devices that should be managed by Univa Grid Engine. Read/write access to all devices in the list will be blocked via cgroups and jobs will only be able to access devices that were assigned to them via RSMAPs. With the following configuration Univa Grid Engine will manage access to all Nvidia GPUs (i.e. all devices from /dev/nvidia0 to /dev/nvidia254):

```plaintext
cgroups_params   cgroup_path=/sys/fs/cgroups devices=/dev/nvidia[0-254]
```

4.1.17 Integration with Nvidia DCGM

Univa Grid Engine 8.6.0 is integrated with NVIDIA’s Data Center GPU Manager (DCGM) that provides detailed information about GPU resources.

**DCGM Load Values**

Support for DCGM can be enabled on host level by setting the execd parameter `UGE_DCGM_PORT` to the port DCGM uses to communicate on the specific host. If DCGM is running Univa Grid Engine will automatically retrieve load values for the installed and supported GPU devices from DCGM. For each available device the load values are reported in the format `cuda.<cuda_id>.<attribute>=<value>` and are visible via qconf -se:
If RSMAP complexes are used to manage GPU devices, each RSMAP id can be mapped to a CUDA device with the new parameter `cuda_id`. The reported load values can then be used by UGE during the scheduling of GPU devices:

```
complex_values gpu=2(gpu0[device=/dev/nvidia0,cuda_id=0] \
  gpu1[device=/dev/nvidia1,cuda_id=1])
```

Please note that up to Univa Grid Engine 8.6.7 DCGM load values contained the host name in the format `<hostname>.CUDA.<CUDA_ID>.<attribute>=<value>`.

**GPU-CPU-Affinity**

If DCGM is enabled, Univa Grid Engine 8.6.0 allows requesting the special load value `affinity`. If a job requests a GPU and `affinity`, it will automatically be bound to the cores that have a good affinity to the assigned GPU. This ensures that the data between the CPU and GPU is transferred in the fastest way possible. `affinity` can be requested as hard request with `-l gpu=1[affinity=1]` or `-l gpu=1[affinity=true]`, or as soft request with `-l gpu=1[affinity=2]`. If it is requested as hard request, the job will not be scheduled if Univa Grid Engine cannot find enough CPU cores needed for a GPU device. If it is requested as a soft request, Univa Grid Engine will try to schedule the job with a GPU/CPU combination with good affinity and schedule the job anyway without binding any CPU cores, if it cannot find a suitable GPU/CPU combination. If less cores are needed the request can be combined with the `-binding` switch.

The following requests a GPU device and binds the cores that have a good affinity to the assigned GPU:

```
% qsub -l gpu=1[affinity=true] -b y sleep 1000
```

**4.1.18 Performance Improvements**

Performance and Scalability of Univa Grid Engine has been improved in the following areas:
• general improvements affecting all components by optimizations of the Univa Grid Engine data store and updated memory allocator (jemalloc library)
• scheduler optimizations for various job profiles, esp. for parallel jobs with and without resource reservation
• higher throughput of the communication library by introducing an additional thread pool for handling incoming/outgoing data
• compression of communication data can reduce network load and avoid network saturation on slow network connections
• the impact of running many qsub-sync, drmaa or drmaa2 clients on sge_qmaster has been reduced

4.1.19 Reworked Dispatch Job Information

The mechanisms that provide Dispatch Job information have been reworked and many issues have been fixed.

qalter -w p is deprecated. Instead administrators should enable scheduler job information by setting schedd_job_info to if_requested in the scheduler configuration so that users can request dispatch job information for individual jobs via -rdi submit switch and make the dispatch job information visible with qstat -j jid.

Administrators have additional possibilities to define limits that reduce memory requirements for dispatch job information.

4.1.20 Data Compression at Communication Layer

The Univa Grid Engine communication library was enhanced to support data compression before transferring data over the network.

Large Univa Grid Engine clusters may produce high network data traffic. The network load depends mainly on cluster size and average job run times. In order to reduce the amount of data sent over the network Univa Grid Engine 8.6.0 supports data compression.

The additional effort to compress the data before sending is handled by introducing a commlib work thread pool which is also used for uncompressed data. On multi core architectures, uncompressed data transfer should show a performance improvement.

Setting up the new compression mode and configure thread pool settings in Univa Grid Engine requires new configuration parameters that are specified in the following Univa Grid Engine configuration areas:

<table>
<thead>
<tr>
<th>man page</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bootstrap(5)</td>
<td>New parameter communication_params in bootstrap file</td>
</tr>
<tr>
<td>sge_diagnostics(5)</td>
<td>Verify and Adjust compression and thread pool setup</td>
</tr>
<tr>
<td>sge_conf(5)</td>
<td>New qmaster_params and execd_params parameter CL_WP_THREADS for setting up work threads (overwrite bootstrap settings)</td>
</tr>
<tr>
<td>man page</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| qping(1) | New compression specific output and options  
(see also qping enhancements section below) |

Summary of changes and enhancements:

- Compression cannot be configured at installation time. It must be enabled manually after installation or update of Univa Grid Engine.
- Univa Grid Engine 8.6.0 uses zlib for data compression - additional compression methods are planned to be supported in follow-up Univa Grid Engine releases.
- Univa Grid Engine 8.6.0 zlib compression is supported for following architectures: darwin-x64, lx-amd64, lx-arm64, lx-arm7, lx-x86, sol-amd64, sol-sparc64, sol-x86  
- The `qping` binary can be used to verify compression settings.
- It is possible to enable compression only for single clients like `(qconf, qstat)` by setting up an environment variable (see `bootstrap(5)` man page).
- Compression setting changes in bootstrap configuration require a restart of Univa Grid Engine daemons.
- Commlib work pool setting changes at `sge_qmaster` and `sge_execd` can be done during runtime of the affected daemon.
- Univa Grid Engine 8.6.0 commlib modifications show a higher performance compared to older Univa Grid Engine versions if compression is not enabled; however this depends on availability of cpus on sge_qmaster host.  
- Turning on compression will cause cpu overhead but dramatically reduces network traffic. Depending on the network speed individual compression settings may need to be adjusted (see `sge_diagnostics(5)` man page).

Also `qping` is enhanced for data compression and commlib work pool settings

- `qping -dump` shows new data compression specific columns (compressed and uncompressed message length, compression ratio and method)  
- `qping -info` shows active commlib work threads and min/max settings for the requested daemon  
- The `sge_conf(5) qmaster_params PROF COMMLIB_TIME` now shows also the nr of active work threads used by commlib in the `sge_qmaster` messages log file.
- `qping` has new command line switches for basic output filtering (`-from`, `-to` and `-format`)

All these additions are described in the `qping(1)` man page.

4.1.21 Using RSMAPs with Topology Masks and XOR Operator

RSMAP complex attributes with topology masks and the XOR operator (```) can be combined to achieve flexible PE task placement and best application performance.

Assume the following definition of the complex attributes `gpu` and `hgpu`:

_Grid Engine Release Notes v 8.6.12_
$ qconf -sclgrep "#name|gpu"

<table>
<thead>
<tr>

Sample setting on a node on host level for complex_values:

2 sockets, 14 cores per socket, 28 sockets in total

```
complex_values gpu=4(0:SCCCCCCCCccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccccc
```

Assume the allocation_rule of the mpi PE is 28.
The first example reserves 4 machines with 28 slots on each machine for one hour immediately. Host level resources are only reserved in the second example (4 hgpus per host, 16 in total):

```
% qsub -pe mpi 112 -d 1:0:0
% qsub -pe mpi 112 -l hgpu=4 -d 1:0:0
```

Submit a job with 4 PE tasks on one host and request 4 hgpus:

```
% qsub [-ar <id>] -pe mpi 4 -par 4 -l hgpu=4
```

While only 4 queue slots on the host will be used, the topology mask of the hgpu resource will mark all 28 cores to be in use. If the cluster is configured that all jobs are submitted with a binding request no other jobs will be dispatched to this machine.

Schedule a job on 4 machines and get any two gpus on each host.

```
% qsub [-ar <id>] -pe mpi 4 -par 1 -l hgpu=2
```

A parallel job which should get the same gpu for each PE task on each host would be submitted as follows:

```
% qsub [-ar <id>] -pe mpi 4 -par 1 -l 'hgpu=1("\")'
```

This is a shortcut for

```
% qsub [-ar <id>] -pe mpi 4 -par 1 -l 'hgpu=1(1阿森纳3 Arsenal4)'
```

If the job should get the two PE tasks with one gpu for each task on the same socket on each host, the XOR operator can be used:

```
% qsub [-ar <id>] -pe mpi 8 -par 2 -l 'hgpu=2([0-1]^2[2-3])'
```

Grid Engine Release Notes v 8.6.12
4.2  Other

4.2.1  JSV Improvements

The Univa Grid Engine packages now contain a Python implementation for JSVs. New example scripts for JSV and core-binding were also added.

Scripts and examples can be found at "$SGE_ROOT/util/resources/jsv".

4.2.2  Reduce qhost Data Request Sizes at sge_qmaster

By setting the environment variable $SGE_GDI_REQUEST_REDUCE_LEVEL it is possible to reduce the amount of data transferred from sge_qmaster to qhost clients. A detailed description can be found in the qhost(1) man page (ENVIRONMENTAL VARIABLES).

4.2.3  Upgrade Advance and Standing Reservations

When upgrading from Univa Grid Engine versions 8.5.4 and higher to Univa Grid Engine 8.6.0 it is now possible to upgrade advance and standing reservations as well by calling

```
# ./inst_sge -upd-ars
```

after the qmaster and execd upgrade are completed.

Prerequisite is that the host on which the upgrade is done (usually the master host) is a submit host and can resolve the user names of the AR owners and in AR acl_list/xacl_list.

See also the chapter about upgrading in the Installation Guide.

4.2.4  per_pe_task_prolog and per_pe_task_epilog

It is now possible to define a special prolog and epilog script that is started for each slave task of a tightly integrated parallel job that is started by qrsh-inherit. The prolog is started before the slave task command or script, the epilog is started after it. See man page sge_pe(5) for details.

4.2.5  Support for nvidia-docker 2.0

NVIDIA provides the version 2.0 of their Docker Container Runtime which allows to access GPUs from within Docker containers. Univa Grid Engine now supports using this Container Runtime.

In order to make use of it, first the execution host has to be installed properly, see https://github.com/NVIDIA/nvidia-docker. The job that wants to use the GPU must tell Docker to use the NVIDIA runtime by specifying the -xd "--runtime=nvidia" switch on the qsub or qrsh command line. In order to select a specific GPU, the environment variable NVIDIA_VISIBLE_DEVICES must be set to for the whole container by specifying it with the -xd "--env NVIDIA_VISIBLE_DEVICES=0" switch.
Both the `-xd "--runtime..."` and the `-xd "--env ..."` switch are supported since Univa Grid Engine version 8.6.3.

### 4.2.6 The Master Task of a Parallel Docker Job in a Container

The master task of a parallel Docker job can now be started in a container. Previously, the master task was started on the host itself but not in a container, while all slave tasks were started in containers. This new behavior requires a properly setup network, container network and DNS. See the Administrators Guide for details.

### 4.2.7 Run the Container as root, Allow to Run Prolog etc. as a Different User

With the `execd_params START_CONTAINER_AS_ROOT` it is now possible to start all Docker containers as root and allow the `prolog`, `pe_start`, `per_pe_task_prolog`, `per_pe_task_epilog`, `pe_stop` and epilog scripts to be started as a different user than the job owner. This change does not apply to “autostart Docker jobs”, i.e. jobs that specify `-b y NONE` as job script in order to use the entrypoint that is defined in the Docker image instead of using the `sgc_container_shepherd` as the container entrypoint.

### 4.2.8 Automatically Map User ID and Group ID of a User Into the Container

If the `START_CONTAINER_AS_ROOT` parameter is set to “true”, it is now necessary that the Univa Grid Engine admin user, the job user and all pre and post script users are defined inside the container. Because this is usually not the case, by setting the `AUTOMAP_CONTAINER_USERS` parameter to “TEMPORARY”, Univa Grid Engine transfers the user ID and group ID of any of these users from the host to the container. But only Univa Grid Engine itself can use this user ID information there, it is not available for the job or any of the scripts started by Univa Grid Engine!

If `AUTOMAP_CONTAINER_USERS` is set to `PERSISTENT`, Univa Grid Engine writes an entry to the “/etc/passwd” file inside the Docker container for all these users. This allows lookup of the user information in a script, but it does not allow to switch to this user!

**Caution!** If `AUTOMAP_CONTAINER_USERS=PERSISTENT` is specified and if a user maps the “/etc/passwd” and “/etc/group” file into the container, the host files are modified!

### 4.2.9 Create a `container_pe_hostfile` with all Container Hostnames

If a parallel Docker job is started where the container hostnames are selected from RSMAPs, the execution daemon of the master task writes a `container_pe_hostfile` with all the container hostnames in the `pe_hostfile` format if the `execd_params CONTAINER_PE_HOSTFILE_COMPLEX` is set to the name of the RSMAP complex that defines the hostnames.

E.g.: If there is a RSMAP “cont_hosts” declared and on each execution host it defines values like:

```
cont_host=4(host1_cont1 host1_cont2 host1_cont3 host1_cont4)
```
and a job is submitted using

```bash
# qsub -pe mype 4 -l docker,docker_images="*image:latest*",\ cont_host=1 job_script.sh
```

and the scheduler decides to schedule the master task to host1, two slave tasks to host2 and one slave task to host3, the "container_pe_hostfile" might contain:

```
host1_cont3  1  <NULL>  <NULL>
host2_cont1  1  <NULL>  <NULL>
host2_cont4  1  <NULL>  <NULL>
host3_cont2  1  <NULL>  <NULL>
```

This allows to read this information in a per_pe_task_prolog and set the hostnames of the containers inside of the containers accordingly.

### 4.2.10 Docker Daemon Response Timeout

A new `execd_params DOCKER_RESPONSE_TIMEOUT` is introduced. This defines the time Univa Grid Engine waits for a response from the Docker daemon to a request Univa Grid Engine sent to the Docker daemon. This does not mean the full response must be received within the timeout; the timeout counter is reset after each character Univa Grid Engine receives from the Docker daemon in response to a specific request.

If this parameter is not specified, the default value of 60 s is used. The minimum timeout is 10 s, the maximum timeout is 86400 s. If `DOCKER_RESPONSE_TIMEOUT` is not within this range, the default value is used.

### 4.2.11 Cgroups and Containers

The cgroups generated by Univa Grid Engine are now used in Docker containers. There is no special configuration value, when Univa Grid Engine is configured to use cgroups, these cgroups are also used within Docker containers.

There is a known issue with cgroups and Docker that is not yet understood:

On some Linux distributions some Docker versions expects the cgroups path to contain a “.slice” postfix, which makes Univa Grid Engine unable to start Docker jobs in cgroups - the jobs will fail then. This was observed on CentOS 7 with Docker 1.12.6 build c4618fb, while it was not observed with Docker 1.12.6 build 78d1802 on the same host. It was also not observed on different distributions than CentOS 7.

There are indications that it could be related to the Docker SELinux packages that are provided for CentOS 7, if they do not match the Docker version exactly, this error seems to be more likely.
4.2.12  Specify Arguments to Autostart Docker Jobs

The autostart Docker jobs, i.e. Docker jobs that were submitted as binary jobs with the keyword None as job script, now accept arguments. These arguments are provided to the binary or script defined in the ENTRYPOINT of the Docker image and are appended to arguments that are defined in the ENTRYPOINT. This works only with suitable Docker images. Whether a Docker image is suitable can be tested by manually starting

$ docker run -it image:latest arg1 arg2 arg3

on the execution host. If the script or binary defined in the ENTRYPOINT gets these arguments, it should also work with an Univa Grid Engine job.

4.2.13  New Client Command qralter

A new qralter client command has been added to Univa Grid Engine allowing to modify existing advance reservations, see User Guide -> Reservations.

4.2.14  Changes to the loadcheck Command

loadcheck will now optionally output information about GPUs available on a host like the GPU name, available memory and cpu affinity.

loadcheck outputs a name and a value column, with Univa Grid Engine 8.6.0 the width of the name column has been increased.

4.2.15  Changed startup behaviour of the execution daemon

The execution daemon startup behaviour can be changed with Univa Grid Engine 8.6.4. Normally, if an execution daemon successfully connects to the qmaster, but does not get its configuration sent, the execution daemon quits. Usually this is the case if the execution daemon runs on a host that is not configured as execution host (yet).

By setting the environment variable “SGE_EXECD_KEEP_TRYING_TO_GET_CONFIG” to “1” before the execution daemon is started, the execution daemon stays running and periodically tries to get its configuration from the qmaster. This allows e.g. to first start the execution daemon and later configure it a the qmaster.

If “SGE_EXECD_KEEP_TRYING_TO_GET_CONFIG” is set to “0” or if it is not set, the old behaviour is in effect, i.e. the execution daemon quits if it does not get its configuration from the qmaster.

See issue GE-6235 “Provide a way to change execd startup behaviour -> infinite connection retries”
4.2.16  **Forwarding the environment for a qrsh (without command) and qlogin job is enabled**

With Univa Grid Engine 8.6.4 and the “builtin” interactive job mechanism configured, it is now possible to forward the environment from the submit host to the job using the “-V” switch, like it is possible for “qsub” jobs all along.

4.2.17  **Suppress the user switch inside Docker jobs**

With Univa Grid Engine 8.6.4 it is now possible to start an autostart Docker job as the user that is defined in the Docker image the container the job uses is created from. In order to allow this, the Univa Grid Engine administrator must configure the “qmaster_params” “ENABLE_XD_RUN_AS_IMAGE_USER=1” (see sge_conf(5)) to allow the users to submit a job with the option “-xd_run_as_image_user y[es]|n[oe]” (see submit(1)).

With this option, an autostart Docker job (i.e. a Docker job that has no job script argument, but the keyword “NONE” instead) is started as the user that is defined in the Docker image specified in the job submit command line.

4.2.18  **Allow to skip Docker image check in execution daemon**

With Univa Grid Engine 8.6.4, a boolean “execd_params” “DOCKER_SKIP_IMAGE_CHECK” was added. If it is set to 1 or TRUE the check if the image for a hard requested docker_images request actually exists is skipped.

See sge_conf(5) for details.

4.2.19  **New values for initial_state of a queue**

With Univa Grid Engine 8.6.4, the new possible values “execd_enabled” and “execd_disabled” have been added for the initial_state parameter of a queue. If set to any of these values, the queue will only be enabled/disabled when the execd is (re-)started, not when qmaster is restarted. The current behaviour if the parameter is set to “disabled” and “enabled” was not changed.

4.2.20  **Removed reporting of m_mem_free_nX load values**

With Univa Grid Engine 8.6.5, reporting of m_mem_free_nX (i.e. m_mem_free_n0, m_mem_free_n1, ..) as well as m_mem_used_nX as loadvalues has been removed. The reason for this change is the lack of information provided by the Linux kernel about Buffers and Caches on NUMA nodes. This can lead to drastically lower values being reported than what is actually available, thus prohibiting jobs from being scheduled onto such a host. Since there is currently no way to report memory values that are at least approximately close to reality, none will be reported.

m_mem_total_nX are still going to be reported.
4.2.21 GPU Affinity as Soft Request

With Univa Grid Engine 8.6.5, GPU affinity for jobs that request GPUs via RSMAPs can be requested as a soft request with `-l GPU=1[affinity=2]`. If a job requests GPUs and affinity as soft request, Univa Grid Engine will try to find and assign a CPU/GPU combination with good affinity (as reported by DCGM) and if there is no suitable CPU/GPU combination available, Univa Grid Engine will schedule the job without binding any CPU cores. A job with `-l GPU=1[affinity=true]` or `-l GPU=1[affinity=1]` will not be scheduled if no GPU/CPU combination with good affinity is available.

4.2.22 Trigger command to force re-read of host_aliases file

With Univa Grid Engine 8.6.7 the qconf client got a new command line switch (-uha) which triggers qmaster to re-read the current host_aliases file in order to adopt changes immediately. More information can be found in the qconf(1) man page. In addition to that sge_conf(5) describes a new qmaster_params setting to disable the default host_aliases check which is done every 60 seconds.

This enhancement can be used to create automated scripts for adding/removing/adjusting the host_aliases file which then will trigger qmaster process to adopt the modifications as fast as possible.

4.2.23 Automatically set jobs to hold state if they trigger errors

With Univa Grid Engine 8.6.7 and 8.6.8 new qmaster_params parameters MAX_FAIL_HOLD and MAX_FAIL_HOLD were introduced. They can be used to define a threshold to set jobs into hold state if the job is responsible for setting queues into error state or many tasks are failing with a job error. Jobs that produce queue errors are usually rescheduled to another queue. This can trigger the situation that a job is responsible for setting all or many queues into error state. Another use case is to stop job task execution when some tasks reporting a job error and it makes no sense to continue further tasks of the job. The new parameters can be used to prevent such situations. More information can be found in the sge_conf(5) man page.

4.2.24 Switch off submit host verification

With Univa Grid Engine 8.6.7 a new qmaster_params parameter ALLOW_REG_SUBMITHOSTS was introduced. It can be used to disable submit host verification. More information can be found in the sge_conf(5) man page.

4.2.25 Log daemon startup errors to syslog

If the variable SGE_USE_SYSLOG_AT_STARTUP=1 is set in the environment of the sge_qmaster(8), sge_execd(8) or sge_shadowd(8), during the startup of the daemon before it is able to log to its messages file, all errors and warning which would be written to a temporary messages file in /tmp are also written to the syslog. If these messages really appear in the syslog depends also on the configuration of the syslog daemon.
4.2.26  Enabled monitoring and deadlock detection feature for all platforms

The deadlock detection (see "DEADLOCK DETECTION" section in manpage for sge_diagnostics(5) ) and message file monitoring (see "MESSAGE FILE MONITORING" section in manpage for sge_diagnostics(5) ) is now supported for all architectures.

4.2.27  sub-cgroup feature

With Univa Grid Engine 8.6.7, it is possible to have the job user get ownership either over all the per-job cgroups created under all subsystems or just under the memory subsystem. This can be acheived with a new execd param, CGROUPS_USER_CONTROL. If set to ALL, the job user gets ownership over all job cgroups under all the subsystems. If set to MEMORY, the job user gets ownership only over the job cgroups under memory subsystem. If set to NONE (default), the ownership is not transferred at all to the job user.

4.2.28  Removing stale “context” entries in queue

Univa Grid Engine stores queue annotation messages ("qmod -msg") in a hidden “context” queue attribute. Those messages were not always deleted when a host was removed from a queue. This could lead to unnecessary hostname resolving in qmaster and have a performance impact when hostnames became unresolvable.

Univa Grid Engine 8.6.9 fixes this issue with GE-7726 and GE-6078. With any queue or hostgroup changes context entries for removed hosts will now be removed.

After upgrading to UGE 8.6.9 or higher it is recommended to make a (pseudo) queue change for all queues. Run as Univa Grid Engine administrator the command

```bash
# qconf -mq <qname>
```

And enter e.g. a space at the end of the first line and save the file. This will remove all stale annotation messages in the context field.

4.2.29  Cleanup of output file path handling

Univa Grid Engine 8.6.10 is fixing the issue GE-8194 (UGE pseudo environment variables replacement not working for qsub -e/-o). The fix also changed following behaviour:

Using a pseudo variable in output files without one additional separation character (e.g. qsub -o "JOB_{DTASK_ID}") did result in not parsing the pseudo variable following a previous one.

The pseudo variable "$TASK_ID" is only supported for jobs with array tasks. For jobs without array tasks definition (e.g. qsub without -t option) the pseudo variable will be replaced with the string "undefined".

More information can be found in the submit(1) man page.
4.2.30 New logging option for hostname or ip lookup calls

Univa Grid Engine 8.6.11 supports a new messages file logging parameter for qmaster and execution daemons. The new parameter “LOG_RESOLVING_TIME” is supported for “qmaster_params” and “execd_params” in the global or local cluster configuration (see sge_conf(5)). It can be used to figure out performance problems when a Univa Grid Engine daemon needs to resolve hostnames or IP addresses via lookup services (e.g. NIS, DNS, ...).
4.3 Full List of Fixes and Enhancements

4.3.1 8.6.0 (and Also Fixed for a 8.5.*, 8.4.*, 8.3.* Patch Release)

GE-3721 qstat -j "*" -u "user1" is not working
GE-5290 qstat (-xml) does not accept filter switches when -j "*"
is specified
GE-5831 UGE REST Server Crashing when POSTing new complex
GE-5941 renewing certificates makes sgepasswd file unreadable
GE-6575 stree-edit utility broken
GE-6697 qstat -j "*" does not support "$user" placeholder set in
sge_qstat request file
GE-6734 wrong scheduler info messages shown for jobs
GE-6764 very long dispatching time due to RQS rule result in
scheduler timeout
UWSA-77 Basic authentication fails under solaris frequently
UWSA-81 Add support for listening only on localhost
UWSA-169 REST Service: 'none' auth method doesn't work
UWSA-186 requested jobEnvironment is not shown in jobs
UWSA-188 jobEnvironment ugerest-sdk contains error in json converter
UWSA-189 ugerest is showing same scheduler conf twice
UWSA-190 upgrade of restlet-jse-2.3.6 to restlet-jse-2.3.10
UWSA-199 UGERest and other jar files do not show their build version
UWSA-200 Add version info route to ugerest

4.3.2 8.6.0 (and Also Fixed for a 8.5.* and 8.4.* Patch Release)

GE-4389 enhance qsub man page with JSV modification examples for
core binding
GE-5835 long scheduling times with wildcard PEs and resource reservation
GE-6018 Setting limits based on percentage.
GE-6103 jobs are bound to cores even if no binding is requested
GE-6356 drmaa2_j_get_info does not provide full job information
   -> not all fields are filled
GE-6402 Scheduler might not respect RQS limits during the time RQS rules
   are changed
GE-6432 qdel -u "*" is only allowed to managers, not to operators
GE-6462 on native Windows (win-x86), environment variable values containing
   an equal sign are truncated
GE-6478 Very long load value of loadsensor causes segfault of execd
GE-6510 Core binding: striding-strategy counts needed cores wrong and
   rejects viable hosts
GE-6511 gdi_request_limits does not behave as documented
GE-6534 sge_execd crash with core dump with GPGPU jobs
GE-6568 Allow for forced job deletion through UGE REST
GE-6595 Docker interactive job can't be deleted by qdel
GE-6671 sudo requests for same user as ugerest service user are rejected
GE-6682 exec host cannot startup if no admin or submit host
GE-6709 huge virtual memory requirements with test DRMAA1 application
GE-6728 sched_conf.5 man page is inaccurate regarding the
PREFER_SOFT_REQUESTS scheduler param
GE-6771 qsub -sync stops immediately on native Windows (win-x86)
GE-6787 qmaster and execd logging "invalid value (33026) for ar->op"
GE-6855 sge_qmaster abort() with critical logging "got NULL element
for RUE_utilized_now"
GE-7237 UGE qmaster daemon may crash in 'lo_thread' thread
GE-7240 UGE qmaster does not handle LO delete cluster request
UWSA-193 additional job usage values for execd_params
  ENABLE_MEM_DETAILS=1 are missing

4.3.3 8.6.0 (and Also Fixed for a 8.5.* Patch Release)

GE-285 allow parallel job allocation scheme be specified at submission time
GE-3146 backfilling a resource reservation before a calendar or an AR is broken
GE-4305 Better documentation for basic share tree use case
GE-4726 adding a way that multiple jobs can be bound to the same socket
  using all cores
GE-5436 qmon should not reset value "-1" for sharetree usage_weight_list list
GE-5569 native Windows (win-x86) sge_execd exits if it cannot access the
  act_qmaster file
GE-5636 qmaster error logging "rc_add_job_utilization 0 slot amount" indicates
  wrong job reservation
GE-5650 with allocation rule $fill_up, slave resource requests are not obeyed
  when master resource and queue requests are provided
GE-5806 parallel jobs might not startup due to wrong RQS calculations
GE-5830 Scheduler fails to handle a job submitted with option "-mbind cores"
GE-5848 allow to use UGE cgroups in Docker jobs
GE-6020 allow native Windows (win-x86) functions to retry to logon users
  several times
GE-6105 RSMAP attributes should support per slot resource allocation for PE jobs
GE-6183 sge_shepherd sets limits too high for master task
GE-6236 accounting file broken on Solaris if accounting line has 1023 characters
GE-6237 jobs are being restarted even if the '-r no' was specified
  during submission
GE-6270 allow to run prolog etc. as root inside a Docker container
GE-6271 sge_container_shepherd fails if the prolog is started as root
GE-6407 add documentation for config-api
GE-6413 shepherd does not handle all error responses to a pull Docker image request
GE-6434 incomplete binding requests shown in qstat for long lists of binding requests
GE-6454 improve documentation of Docker integration
GE-6480 wrong/missing error messages and wrong exit status when initializing
  invalid RSMAP ranges
GE-6483 document placeholders in Docker requests in the UserGuide and man pages
GE-6489 use of external loadsensors might deadlock execution daemon
GE-6490 load sensor specific errors are not logged into execd messages file
GE-6493 RSMAP map entry selection request does not work
4 Fixes and Enhancements

GE-6497 support halftime -1 setting in scheduler config to disable past usage for sharetree
GE-6506 qstat does not show granted PE
GE-6508 Accounting shows wrong fail and exit states for 'qdel -f jobID'
GE-6521 Qmaster Crashes with LO Enabled and Job Dependencies
GE-6524 AR shouldn't be scheduled to unknown queue instances at time of submission
GE-6527 document qsub -xd --help
GE-6528 allow to specify arguments to autostart Docker jobs
GE-6536 No error message when a job cannot get scheduled due to RSMAP-ranges
GE-6537 Submitting RSMAP-range jobs via -adds is broken
GE-6549 qstat/qhost outgoing packet size is much bigger than the data which is finally displayed
GE-6553 RQS limits incorrectly applied when PE job submitted with "-l h=<host>"
GE-6566 qsub rejects valid RSMAP resource requests
GE-6569 allow for Deletion of non jobsession jobs in DRMAA2
GE-6573 reduce resulting qhost client requested data sizes transferred via network
GE-6583 scheduler is wrongly skipping hosts or queue instances for parallel jobs that are using master task specific requests
GE-6597 execd uses 100% CPU if it can't delete a finished Docker container
GE-6615 enhance error logging if load sensor cannot be started
GE-6617 provide workaround in native Windows (win-x86) sgeexecd.bat script for start /b bug on Windows 10, version 10.0.15063
GE-6618 native Windows (win-x86) execution daemon crashes if qloadsensor does not work
GE-6620 error messages from qloadsensor.exe (win-x86) are not forwarded to the execd messages file
GE-6623 add the UGE admin user to the Performance Monitor Users group on native Windows 10 (win-x86)
GE-6629 qhost NSOC and NCOR incorrect on lx-arm64
GE-6637 using hostgroups in rqs limit definition can trigger short qmaster hang at startup or rqs modify request
GE-6640 qloadsensor.exe report "no error" if an error occurs while initializing the PDH service
GE-6644 any epilog SIGSEGVs and sets queue in error state with execed_params INHERIT_ENV=false
GE-6648 Host aliases are configured qsub -sync y reports "commlib info: successfully updated host aliases (add: 0, del: 0)"
GE-6655 while a non allocated reservation is "active" in a standing reservation jobs submitted into the SR get rejected
GE-6670 The global configuration parameter "gdi_request_limits" not working for aliased hostnames
GE-6678 Improve accept() handling in commlib
GE-6687 RSMAP-topology-masks jobs and -binding jobs result in wrong scheduling decisions
GE-6695 qrstat does not output cal_depth and cal_jmp information for standing reservations
GE-6696 save_sge_config.sh needs to dump advance/standing reservations for upgrade to newer versions
GE-6706 unexpected logging and possibly incorrect accounting if multiple
array tasks of a job are running on a host
GE-6713 shadowd on Solaris cannot start sge_qmaster
GE-6737 queue calendars closing queues not considered when max_reservation > 0
GE-6739 Parallel job requesting pe range not scheduled even if resources available
GE-6741 jobs submitted into AR with RSMAp resources are not scheduled
GE-6744 qrstat does not output queue request (-q) and immediate request (-now y)
GE-6746 support a "pack socket" core binding strategy
GE-6754 Adding new session (qconf -asi) not working on admin only host
GE-6755 save_sge_config.sh does not dump all advance/standing reservations
GE-6774 Jobs do not get the correct binding when a specific RSMAp id with topology mask is requested
GE-6775 RSMAp ids are granted even if the requested cores are already in use
GE-6782 qstat -njd is not working as documented in the man page
GE-6785 Supplementary groups in manager and operator lists are ignored during access validation for job deletions.
GE-6786 false logging for 'qmaster_params': 'gdi_timeout', 'gdi_retries' and 'gdi_ping'
GE-6788 qmaster logging about receiving older load report
GE-6796 Calendar modification/state transition might cause repeated timed calendar events for up to one second.
GE-6799 unexpected logging messages in sge_qmaster messages file
GE-6800 implement a per task prolog and epilog for tightly integrated parallel jobs
GE-6812 started docker job at execd may result in sge_shepherd process eating up all memory
GE-6814 removing non "lo_*" complex entry triggers error logging of lothread
GE-6818 error logging: getgrgid(...) failed: Numerical result out of range
GE-6826 Spaces within a comma separated list of switch arguments are not allowed
GE-6829 disallow mapping /etc/passwd and /etc/group into the container if AUTOMAP_CONTAINER_USERS=PERSISTENT is specified
GE-6835 update host configurations for changed hostnames not working if a changed hostname is matching as substring of another host
GE-6836 improve execd reconnect behavior after qmaster shutdown and restart
GE-6841 allow to configure the Docker daemon communication timeout
GE-6843 Integration with latest Docker CE version(17.09)
GE-6852 interactive Docker jobs take very long to finish if the qrsh client is killed and an epilog is configured
GE-6853 Sometimes not able to delete pending job if docker device-mapping is used
GE-6862 Release notes contain 'current version' also for features that were introduced with FCS
GE-6869 arch script does not support Mac OS X High Sierra
GE-6874 normal docker job required no_root_quash if execd spooling directory shared via nfs
GE-6884 qconf help menu lists ss switch twice
GE-6901 "messages" file can have the name ".<digit>" instead of "messages" in case of file creation issues
GE-6907 Allow to specify allocation rule (-par switch of qsub) via JC's
GE-6913 expose scheduler thread ID in the qping output
GE-6916 sge_ca script does not show output for skip install question if CA
directories are already existing
GE-6924 PE jobs that request a combination of consumable HOST/JOB and YES
RSMAP complexes might not get the correct amount of ids assigned
GE-6931 the main shepherd of an interactive Docker job uses 100% CPU and
doesn't end if output file is deleted
GE-6932 child shepherd waits infinite for mutex in shepherd_trace()
GE-6934 jobs that are submitted into AR and request RSMAP ids block ids
that were not assigned
GE-6939 very long ticket calculation times for parallel array tasks
GE-6945 cannot create AR for queues with jc_list "ANY_JC"
GE-6946 Delete an array task will break the -tc <number> condition
GE-6948 parse error message from Docker response and provide it as job
error reason
GE-6959 sge_execd calls sched_setaffinity function repeatedly
GE-6972 Problem with gridengine/kernel
GE-6973 Problem with gridengine/kernel
GE-6974 Problem with gridengine/kernel
GE-6983 if job is killed by execd enforced limit the job failed state in
accounting file should reflect this
GE-6997 the native Windows (win-x86) execd should log that it cannot find
or start the qloadsensor.exe
GE-7002 test Docker integration with Docker versions up to 17.12
GE-7008 Jobs requesting RSMAP complexes that are defined without Ids are
not scheduled
GE-7009 no job dispatching with max_reservation > 0 and
consumable+PE+binding combination request
GE-7027 In AFS/KRB Grid Engine installations coshepherd/set_token_cmd is
not cleaned up
GE-7039 AR slot oversubscription
GE-7042 Resource reservation due to start time prevents dispatching the
next job of the same category
GE-7056 Failed/deleted docker interactive job's shepherd remains and
increase trace file forever
GE-7060 Possible crash of qmaster clients
GE-7062 reservation for PE jobs with RSMAP requests is too far in the future
GE-7063 submitting an AR to a PE can violate the PE's fixed allocation rule
GE-7067 jobs with reservation and RSMAP complex requests cause error
logging in qmaster messages file
GE-7068 PE jobs that request binding and RSMAP complexes defined as
consumable HOST might not be scheduled
GE-7069 running jobs requesting host level consumable prevent ARs to
be scheduled
GE-7078 ARs not backfilled with backfilling=h_rt
GE-7085 Logging of PDC create execd message owned by root user
GE-7108 CRITICAL "error: lGetElemStrFirst(ST_name): run time type error"
when submitting advance reservation with project
GE-7111 CSP effective secret key algorithm is not used correctly
GE-7112 qmaster error logging "rc_add_job_utilization 0 slot amount
(job <job_id> obj global type RUNNING)"
4.3.4 8.6.0

GE-168  enhance qacct [-A account_string] to qacct [-A [account_string]]
GE-639  job umasks should be configurable per job
GE-1969 qconf -me reports success on incorrect file
GE-2186 sched job info shows old and outdated message although job is meanwhile running.
GE-2242 Inadequate job_info messages for resource quotas with parallel jobs
GE-2464 sched_job_info can cause immense memory consumption
GE-2739 No way to remove a -notify flag, once it was set
GE-2748 Jobs with no suitable queues at all should be easier detect
GE-3279 Description of 'job_is_first_task' in 'man sge_pe' should be rephrased
GE-3614 add a way to distribute a parallel job on different sockets without knowing the exact architecture on submission time
GE-3621 add a placeholder for the -binding parameter which aligns the amount of slots with the amount of requested cores
GE-3754 write documentation for sge_share_mon
GE-3787 string load values are reported only up to 1024 characters
GE-3803 qacct fails with accounting files bigger than 4GB on native Windows (win-x86)
GE-3864 qsub -w e/-w v do not consider attributes which are load values only
GE-3965 qalter -w p of a job in user hold prints 'verification: job is already running'
GE-4028 DOS CR-LF in submitted scripts causes shell search errors
GE-4059 qalter -clearp silently exits
GE-4275 qalter -w e|v|p <job_id> identifies jobs as running when they are not eligible for scheduling
GE-4358 misleading diagnose message for qalter -w p that refers to queue 'global' instead of host
GE-4429 Improve qalter -w option documentation
GE-4430 Qalter -w p on a held job says 'job is already running'
GE-4433 qalter returns nothing when run without a job
GE-4498 man lacks detailed information about the new pss, rss, smem, vmem values
GE-4678 job class parameter V does not work like described in sge_job_class man page
GE-4733 finding rqs excluded queues is printing a useless error message
GE-4734  reduce impact of qalter \(-w\ p\) on sge_qmaster operation
GE-4785  qmod \(-rq\) can trigger a qmaster crash when the queue is in "o" state
GE-4793  qalter \(-tc\) messages are not displayed, each time of execution
GE-4794  Information about the setting of tc switch can not be retrieved
GE-4817  Add automatic corebinding magnitude selection when used with PE's
GE-4820  Document the \(-u\)' Options to qsub as a way to validate job submissions
GE-4825  provide Python binding for JSVs
GE-4839  rescheduling might produce unexpected error messages
GE-5069  new binding strategy "linear_socket" instead of requesting "linear" plus \(-l\ sched-binding-per-socket=1\)
GE-5084  qmaster_params "OLD_SCHEDULE_BEHAVIOR" should not be declared deprecated
GE-5100  forwarding of job error messages from native Windows (win-x86) exec hosts to qmaster
GE-5248  remove deprecated gdi_multi_read_req setting
GE-5281  Add support for devices subsystem in cgroup integration
GE-5304  bug in mirror interface causes segfault in drmaa2 application
GE-5395  adding a way for listing the state of all global resources
GE-5403  Job should run on free core first
GE-5471  Need tool to provide overview of used and requested cluster resources
GE-5535  enable schedd_job_info for specific jobs only
GE-5537  standing reservation, which enhances the AR
GE-5542  request for a rerun limit for jobs
GE-5571  qalter \(-w\ e|v|p\) does not take RQS limit rules into account that contain job class filters
GE-5573  scheduler triggers job delivery before complete execd cleanup of rescheduled job
GE-5606  pe_hostfile documentation is not exact enough
GE-5686  prolog/epilog race conditions when jobs are rescheduled
GE-5691  qrsh \(-cwd\) is broken
GE-5706  gdi_request_limits parameter is missing in global config
GE-5725  upgrade procedure fails if LO_ROOT is set
GE-5753  job in hold state gets tickets and is reported as running by "qalter \(-w\ p\)"
GE-5773  Ability to change the cgroup name 'UGE' to another name
GE-5799  Deliver Univa Grid Engine software as RPMs
GE-5857  handle delete requests of event clients preferred
GE-5872  gdi_request_limits should support to limit event client registrations
GE-5888  resources defined in the global host are not available for -masterl requests
GE-5910  make DRMAA2 compatible with the AR object changes
GE-5911  make WebService API compatible with the AR object changes
GE-5919  correct sge_diagnostics man page header and footer
GE-5924  Standing Reservation XML output
GE-5926  Standing Reservation must go in Error state when no more allocations are possible
4  Fixes and Enhancements

GE-5927  support to upgrade standing reservations
GE-5928  support Python configuration API for standing reservations
GE-5939  re-implement manual re-scheduling done by qmod -r
GE-5947  drmaa2 complete reservation session features
GE-5956  re-connect request for an event client even on qmaster shutdown
GE-5963  qalter -w p doesn't report correctly when -master1 switch is used
GE-5987  examine fopen() system call problem
GE-6014  Enhance sge_diagnostics man page with info about scheduler profiling
GE-6038  schedd_job_info true/false is not case insensitive
GE-6071  Support for Affinity/Anti-Affinity in UGE
GE-6086  Fix Java code (JGDI, UGEREST etc.) to support standing reservations

for demo binaries the version string printed by -help command line option and in messages files should contain "demo"

GE-6125  update berkeleydb to version 6.2
GE-6141  DRAMA2 still does not use GDI sessions which will have an impact on performance
GE-6143  qalter -w p requests are executed by worker threads
GE-6147  category string should be created and normalized in qmaster thread when jobs are added or modified
GE-6159  add qralter to modify end time of Advance Reservations
GE-6249  remove qtcsh from distribution
GE-6255  execd job reports get lost due to a race condition in sge_qmaster
GE-6256  Parallelize sorting in CULL to improve scheduler performance
GE-6260  Compression/decompression of data passed/received from commlib layer
GE-6261  event_master thread performance might be improved by processing events for different event clients in parallel
GE-6275  Determine number of unused cores (threads) in qmaster and execd
GE-6277  Improve performance of basic CULL functionality
GE-6287  Move scheduler category to master
GE-6328  out-of-the-box functionality to show utilization of global variables
GE-6334  hostgroup changes via -*attr do not update queue instance settings
GE-6339  QERROR message should include task ID for array jobs
GE-6364  check if username needs to be part of the scheduler category string
GE-6412  deny job submission with empty non boolean request
GE-6415  core binding jobs fail to be scheduled on free cores.
GE-6418  Implement host_sort_formula in schedd configuration object
GE-6424  Adapt config API to reflect object changes
GE-6439  possible performance degradation in scheduler when debiting dispatched jobs
GE-6440  create and maintain affinity cache in worker / scheduler thread
GE-6441  output affinity information with qstat -F and qhost -F
GE-6450 change naming scheme of fallback messages files
GE-6455 Look at all open, fdopen, close, etc. calls and map them to a
global function
GE-6458 qconf -srql and other "show list" options report an error if no data is configured
GE-6468 Introduce and document new parameter that influences host
resolving timeout handling
GE-6476 Enhancing sge-diagnostic man page
GE-6482 scheduler profiling does not cover full scheduler code
GE-6484 Wrong/missing error-logging for loadsensors
GE-6491 affinity shall only be reduced for preempted jobs for complex
variables which are preemptable
GE-6492 change host and queue sorting in scheduler thread to reflect
affinity
GE-6494 Wrong binding-parameters are logged in qmaster-messages file
instead of sent to client
GE-6499 Add entry for "used_slots" to sge_pe man page & admin guide
GE-6500 fix compensation_factor description in sched_conf(5)
GE-6526 Excessive Memory Usage with large RSMAP Ranges
GE-6530 Core binding: Binding request for PE-jobs should be "per task"
instead of "per host"
GE-6531 Core binding: execd applies granted core-binding for PE-jobs
in a wrongish way
GE-6532 Core binding: Create new binding strategies with better names
GE-6533 Core binding: Number of granted cores should be part of accounting
GE-6538 Add RSMAP-ranges as <name>:<amount> to a host does not work
GE-6540 remove queue_sort_method from scheduler config (replaced
by weight_queue_seqno)
GE-6544 Core-binding: qsub checking of binding-strategy is not strict
enough (linearasdf:4 is accepted)
GE-6545 adapt Docker version check functions to new Docker version scheme
GE-6561 Core binding: Remove scheduler parameter "sched_binding_per_socket"
GE-6567 ranges in combination with RSMAP id requests do not work
GE-6578 Duplicate calendar entries associated with host_aliases
GE-6600 Core-binding: cgroups with PE-jobs not correct
GE-6611 build unsupported platforms with classic spooling support only
GE-6622 Order of fields in the accounting man page does not match
qacct output
GE-6638 accounting(5) man page field description is broken for "ioops"
GE-6642 operators cannot delete a (standing) reservation
GE-6646 Add support for NVIDIA DataCenter GPU Manager
GE-6647 Automatically use affinity for GPU and CPU where possible
GE-6649 Use environment variable CUDA_VISIBLE_DEVICES to hide disabled GPUs
GE-6655 Document how to tag CPU cores as 'already in use' so that they
will not be considered for core and memory binding
GE-6666 qhost man page is lacking description for resources that are
free-but-still-bound
GE-6677 DRMAA jobs submit always with -w e which has a negative performance
impact on qmaster
GE-6691 support halftime -1 setting in scheduler config to disable past usage for sharetree
GE-6692 cleanup of CULL for halftime -1 that requires minor release change
GE-6693 allow to set halftime to -1 in qmon/config API and UGE Rest
GE-6707 qalter -w e1w does not return a validation message.
GE-6708 qping and other uge binaries dump core if local hostname is not resolveable
GE-6720 calendar-off times not considered by resource reservation
GE-6736 Remove Solaris dtrace support and related things from UGE and LO
GE-6738 dmas2_open_jsession does not recreate htable of job, jtemplate and jinfo
GE-6752 update jemalloc to current version (5.1.0)
GE-6753 update hwloc lib to current version (1.11.7)
GE-6758 switch to a newer OS (e.g. CentOS 6) for the lx-* build
GE-6761 qrstat -ar <ar_id> prints the PE request as granted_parallel_environment
GE-6766 xml schemas need to be verified, updated and made UGE version specific
GE-6772 update man page for queue initial_state to include qmaster migration scenario
GE-6781 qstat -j reports job as running but shows also schedd job information why the job cannot be started
GE-6783 shepherd trace file grows too large for interactive Docker jobs
GE-6831 Alternative solution to limit the number of event clients in use by abusive users
GE-6834 unexpected logging on rescheduling of tight pe jobs
GE-6837 config-api test in master branch fails due to missing field per_pe_task_prolog
GE-6839 sge_execd is not properly handling short outages of sge_qmaster resulting in delayed reporting of load values
GE-6840 Generate all nroff man pages from markdown source files
GE-6854 pe_n, pe_min_X, pe_max_X missing in jsv(1) man page
GE-6857 requesting RSMAP complexes as soft request with -soft and/or l_soft does not work
GE-6859 qacct -A does not show column name with account string
GE-6860 Implement a way to disable the chaining of RSMAP ids
GE-6887 reduce the number of copy operations done in event master thread when distributing events to clients
GE-6891 qalter -clearp does not provide a proper response message
GE-6902 enable immediate load report sending
GE-6903 improve communication connection shutdown and gdi timeout handling
GE-6917 chaining of multiple RSMAP complexes with XOR parameter does not work
GE-6918 it is possible to specify invalid PE allocation rules
GE-6919 config-api missing field
GE-6920 update openssl library to most current version
GE-6923 Add job category field to 'qstat -j' output
GE-6947 show user name trying exceed max_u_jobs on qmaster message log
GE-6955 cgroups definition of subdir_name only working if beginning with "/" on some docker versions
GE-6982 accounting should contain the pe task id for tasks of tightly
integrated pe jobs
GE-6991 extend monitoring to track time waiting in mutex_lock
GE-6993 environment of Docker pe task shows wrong RSMAP ids if complex
is consumable YES
GE-7001 wrong behaviour if RSMAP topology mask does not fit on actual
host topology
GE-7017 support XOR RSMAP request per PE task only
GE-7020 Enhance current commlib message protocol to support compression
GE-7026 build process for markdown man pages is broken
GE-7031 display requested RSMAP selection in qstat -j/qstat -r
GE-7038 enhance qping to show compressed data size if applicable
GE-7041 qalter might cause error message and reject the modification
if combined with -w
GE-7045 backup might fail with "mv: cannot move ... File exists"
GE-7054 Integrate zlib into build process
GE-7057 Rescheduling due to preemption does not respect force-switch
GE-7058 make compression configurable
GE-7064 SGE_HGR_ variables are set to wrong values when consumables
are requested via -master1 and -l
GE-7065 debiting of PE jobs is wrong if they contain a "-master1" request
GE-7099 correct the message displayed during upgrade procedure
GE-7122 write -xd parameters into job config for non docker job
GE-7134 update berkeley db libs to current version (6.2.x)
GE-7135 update postgresql libs to current version 10.x
GE-7146 mbind nlocal not functioning properly (even in 8.6.0)
GE-7159 Increase performance of worker threads for job delivery
GE-7177 integrate performance tools support for UGE/L0 build process and TS
GE-7179 optimize RQS code that consumes much cpu time in parsing for lWhere
GE-7180 optimize scheduler runtime by optimizing CULL functions and
other low level UGE functions
GE-7185 AR verification of jclass parameter is either missing or does
not handle special keywords
GE-7190 update nvidia cudatoolkit used for cuda_load_sensor to current version
GE-7197 interactive Docker jobs do not end if the docker container is
killed and no input is provided to the qrsh client
GE-7202 category string in accounting file is wrong for RSMAP requests
GE-7205 greedy RR: job is backfilled although it should not
GE-7206 greedy RR: qstat -rr shows negative job ID
GE-7225 remove GUI installer from distribution packages
GE-7234 cgroups support does not work with Docker 1.13.1-63 provided by CentOS
GE-7245 Can't update from 8.4.5 to 8.5.5 with CSP configured
GE-7249 The qacct -A switch is showing wrong values
GE-7250 restarting sge_qmaster with bdb spooling invalidates sharetree node
ids in qconf -sstree output
GE-7252 No config-update for execution daemons if reader threads are disabled
GE-7275 wrong handling of thread local storage can trigger crash on
qmaster shutdown
GE-7281 qalter -V exit code is incorrect when environment variables
like LD_LIBRARY_PATH are set
4.3.5  8.6.1

GE-6950 A Docker job requesting duplicate mount points sets the host in error state
GE-7285 Make python-JSV work with version 2 and 3
GE-7290 qconf -sconf requires manager privileges
GE-7328 qstat -r is showing wrong values for requested resources
UWSA-206 ugerest api is failing with TLS memory allocation error

4.3.6  8.6.2

GE-7350 jobs are no longer started after having been modified via qalter by job name
GE-7354 do not use jemalloc on lx-arm64

4.3.7  8.6.3

GE-5257 Customer would like back the -binding option for qlogin
GE-6053 for docker jobs need to create additional binds
GE-6207 qstat -j<multiple_job_ids> prints all reservation times of all jobs for every job
GE-6542 A more detailed 'Best-Fit' example should be added to the admin guide
GE-6813 removed unresolvable admin and submit hosts re-appear after qmaster restart with BDB spooling
GE-6848 qconf -sds should also show cluster queues that have no queue instances
GE-6890 for Docker jobs and execd spooling on root_squash too many files have write permissions for others
GE-7055 Support docker run --env option by qsub -xd for docker container job
GE-7096 support for nvidia-docker 2.0
GE-7142 qstat -j shows env=NONE for jobs submitted with variable without value (-v var=)
GE-7335 execd crash due to expand_path - instead of -/
GE-7345 lothread should wait for lodail to be ready before sending state changes
GE-7349 description of DISABLE_NAME_SERVICE_LOOKUP_CACHE in sge_conf is incorrect
GE-7351 sge_shepherd stays running if Docker job is deleted
4.3.8 8.6.4

GE-4540 enable -V switch for qrsh (without command) and qlogin command
GE-5805 Provide limit to 'exit 99' re-scheduling attempts
GE-6235 Provide a way to change execd startup behaviour -> infinite connection retries
GE-6451 sge_do_log() function doesn't try to write a panic file if logging to the messages file is not possible
GE-6473 sge_share_mon issues
GE-6512 implement a way to suppress the user switch inside docker images for docker jobs
GE-6650 Make GPU affinity manually configurable
GE-7036 more info on qmaster message log when -tcon yes for non array job
GE-7088 add a CLIENT_COMMAND parameter to JSV
GE-7209 named pipe execd-shepherd file descriptor leak
GE-7271 support to set "loglevel" in local cluster configuration
GE-7310 ensure UGE compatibility with DCGM versions up to 1.4.6
GE-7337 -xd --shm-size doesn't work correctly
GE-7359 More information in qmaster message log when job request invalid host
GE-7388 "commlib returns can't find connection" errors for "qsub -sync" jobs
GE-7438 frequent logging of "deletion of one or more tasks skipped for job..." in qmaster messages file
GE-7440 add support for -umask switch to qrsh

Grid Engine Release Notes v 8.6.12
4.3.9 8.6.5prealpha_devbuild_1

GE-4575 deleting array tasks can block qmaster for a significant time
GE-4638 showq does not take d_rt into account
GE-4823 Missing header in sge_conf(5) for cgroups killing parameter
GE-5730 support UGE on IBM Power 9 architecture on Linux (lx-ppc64le)
GE-5912 comma-separated userset-lists are not accepted
GE-6584 mem_free should be allowed to increase even for running jobs
GE-6700 low m_mem_free load values prevent job dispatching
GE-6749 "qstat -s r" is broken for array jobs with suspended tasks
GE-6750 "qdel -s r" is broken for array jobs with suspended tasks
GE-6801 accounting man page field description is wrong for "wallclock"
GE-6805 incorrect booking of consumables results in scheduling errors and
massive error logging
GE-6830 enable RSMAP placeholders to be resolved for -masterl requests, too.
GE-6832 Add more information from man page to userguide/admin guide
GE-6863 job with -pty yes failed if output was directed to folder
with permission 754
GE-6958 execd should also cleanup dockers cgroups dir inside cgroups uge
jobs dir if not done by docker
GE-6978 UGE/cgroup leaves orphan processes after qdel if the job is
submitted within an tightly integrated openmpi
GE-6990 DRMAA2 Python binding to support customer workflow
GE-7244 ensure that all generated man page (not only NROFF) are part
of the packages
4 Fixes and Enhancements

GE-7268 projects & xprojects fields in execution host configuration, not allowing comma separated values
GE-7332 pending job with "-tcon y" and "-t" prevents other jobs from running
GE-7337 "-xd --shm-size" doesn't work correctly
GE-7343 add a commlib parameter not to do hostname resolving but parse the ip address out of the hostname
GE-7383 put all queue instances on host in error state on Cgroups related errors
GE-7391 PE slave tasks should be handled in own cgroups
GE-7434 Use OOM Notification API in UGE Cgroups implementation to notify when jobs exceed memory
GE-7443 'sgeexecd stop' fails if corresponding host is no admin host
GE-7469 Unable to edit queue slots configuration using qconf -dattr
GE-7475 enhance monitoring information of reader thread that does event processing
GE-7476 sge_get_config_version_for_host() does hostname resolving which can be avoided
GE-7482 handle permission check GDI requests in listener thread.
GE-7483 add a possibility to give manager requests higher priority
GE-7487 use sge_mutex_lock instead of pthread_mutex_lock in all modules used by sge_qmaster
GE-7489 improve performance for qmod -rq
GE-7490 new added execution hosts not handling reschedule_unknown setting
GE-7492 bad dispatching rate with many big array jobs in a huge cluster
GE-7495 rescheduling of sequential jobs unnecessarily creates timer events
GE-7496 enable cgroups based killing for PE tasks
GE-7499 shepherd should not be part of the memory Cgroup
GE-7502 add scheduler param to supress sending of running job tickets
GE-7503 improve general rescheduling performance
GE-7504 improve reschedule_unknown triggered rescheduling behavior on massive execution host lost
GE-7505 add additional worker pool that allows to handle priority requests
GE-7506 improve performance of adding large number of execution hosts
GE-7511 newline in jsv_add_env function let qsub crash
GE-7513 unexpected logging: invalid task number 0 for job ... in "ORT_ptickets" order
GE-7519 execd might not always send a load report within configured load_report_time
GE-7520 unexpected connection renewal of execution daemons
GE-7528 qconf -si sid is ignored if not used as first switch
GE-7540 jobs do not get the correct binding if affinity is requested and the affinity mask is overwritten with a topology mask
GE-7546 job cleanup problem for PE jobs at execution daemon
GE-7550 do not report m_mem_free_nX/m_mem_used_nX as load values
GE-7556 implement deadlock detection for sge_qmaster daemon
GE-7574 concurrent array jobs (-tcon yes) get partially started when the number of running tasks exceeds maxujobs
GE-7586 qmaster becomes unresponsive and needs 100% CPU after qralter
GE-7592 ensure UGE compatibility with DCGM versions up to 1.5.6
GE-7594 resources held by a standing reservations are not properly freed when the standing reservation is modified or is deleted after sge_qmaster restart
GE-7595 standing reservation id restarts at 0 after modifying resource requests with qralter
GE-7597 resources held by a standing reservations are not properly freed when the complex_values of the queue are modified
GE-7654 massive logging of "GDI session <string>: created=<nr>, processed=<nr>, required=<nr>"

4.3.10 8.6.5prealpha_devbuild_2

GE-3942 qmon man page refers to schedd_conf(5)
GE-3946 Explain priority normalization and fix issues with sge_priority man page
GE-4020 getservbyname segfaults when called with wrong amount of arguments
GE-4381 Enhance error message logging for flat file spooling
GE-4402 SGE_DRMAA_ENABLE_ERROR_STATE variable is not documented in wiki pages
GE-4469 Need clear description how to handle certificates within UGE CSP installations
GE-5125 Add addition information in man page for qsub
GE-5305 jsv does not recognize -now switch
GE-5346 qdel <jobid> -t <taskid> deletes complete job
GE-6751 qalter -clearp and -clears doesn't delete "hold_jid" attributes
GE-7517 queue is set in error state if Docker daemon is overloaded
GE-7553 SR in error state because past SR instance is in "E" state
GE-7572 Docker background process doesn’t allow to exit the interactive job
GE-7580 cgroup directory of docker job remains although job finished
GE-7581 PE job with consumable HOST request doesn't get correct resources if max_reservation is greater than 0
GE-7587 Fix spelling errors in AdminGuide
GE-7596 docker -xd command can’t export multiple values
GE-7598 Docker jobs set queue instance in error because permission to write pe_hostfile is denied
GE-7626 consumable records in the reporting file end with a delimiter (comma)
GE-7645 job killed by cgroups limit results in zero values for "ru_*" usage fields
GE-7646 job killed by cgroup OOM notification is pending in "E" state
GE-7656 need parameter to enable qmaster abort() when a deadlock was detected
GE-7657 improve deadlock detection reliability
UWSA-230 Restarting Qmaster Breaks Synchronization With UGEREST
4.3.11 8.6.5prealpha_devbuild_3

GE-4378 Respect better parsing for admin user in bootstrap file
GE-5513 "The filename or extension is too long" error when creating job process on native Windows (win-x86)
GE-5801 Windows (win-x86) qloadsensor.exe doesn't recognize if execd is killed or crashed
GE-5826 port RESTRING matching to native Windows (win-x86)
GE-6019 Improve error logging of native Windows (win-x86) RedirectStdHandles() function
GE-6222 UGE Starter Service of native Windows (win-x86) fails to start second execd if the first cannot be started
GE-6223 add check to native Windows (win-x86) installer if an execd is already installed to the same $SGE_CELL or uses the same port
GE-6226 the native Windows (win-x86) execution daemon doesn't report m_cores, m_sockets and m_threads
GE-6809 Could not edit non reserved complex when advance reservation with pe is running
GE-6896 qconf -me parser allows to define a RSMAP twice which cause sequential errors
GE-7059 qsub job verification "-w e" is executed before server side JSV run
GE-7323 sgepasswd tool enhancement or change of behaviour
GE-7623 wrong debiting of consumables with consumable type HOST
GE-7624 support Docker up to version 18.09
GE-7641 newlines in qmaster messages file after hold modifications breaks file format
GE-7697 it is possible to remove a host exclusive consumable from a host which is referenced in an AR
GE-7698 rqs: wildcard projects with at least two different limits crashed qmaster
GE-7704 make sure libxml2.dll exists on native Windows (win-x86) exec host
GE-7705 port work binary to native Windows (win-x86)
UWSA-223 ugerest should not truncate /tmp/UGERestService0.0.log at startup

4.3.12 8.6.5alpha1

GE-3938 Man page sge_priority needs prio/pprio clarity
GE-4391 add more information about the importance of the gid range to the install guide
GE-4454 The sge_priority man page has a typo regarding prior calculation
GE-5299 A way to remove hold_jid switch
GE-6457 log full communication between shepherd and Docker daemon to the shepherd trace file
GE-6802 job are handled as still running, even if all processes are already stopped
GE-7028 Completed job remains in dr state and is not cleaned up at execd
GE-7243 man page qsub -P description incorrect
4 Fixes and Enhancements

GE-7253 errors with consumable capacity management after "qalter -when now" or after reduction of capacity
GE-7336 typos in AdminsGuideGE, chapter 3.9.5, Tuning the sge_shadowd
GE-7404 cgroups based devices blocking mechanism does not block all devices
GE-7606 ./inst_sge -copycerts <hostlist> command line parsing not correct
GE-7636 Docker -xd doesn't work for --sysctl option
GE-7693 re-schedule standing reservations without allocation or being in error state
GE-7710 handle leak in UGE Job Starter Service causes start failures of some jobs
GE-7720 active SR stays in "E" state after qmaster restart even after all execds reconnect
GE-7724 not all markdown man pages are part of the packages
GE-7736 qalter -when now might break EXCLUSIVE consumable functionality
GE-7750 synchronize execd signaler thread with execd main thread
UWSA-157 Job State can be stale until full job refresh
UWSA-176 clusterqueuesummary contains null entry when hostlist is NONE in queue
UWSA-216 Cannot view tasks in Rerun Queue (Rq) State
UWSA-222 ugerest connection and shutdown issues
UWSA-224 ugerest does not log its version information at startup

4.3.13 8.6.5alpha2

GE-6648 Make GPU/CPU affinity a possible hard and soft request
GE-6652 Implement DCGM callbacks in case of GPU failures
GE-7362 Document RSMAPs in man-pages and Usersguide, including their request-syntax
GE-7673 RQS computes double usage for RSMAPs of type HOST for PE jobs
GE-7748 formatting issue makes subordinate example impossible to read
GE-7762 ensure UGE compatibility with DCGM versions up to 1.6.3

4.3.14 8.6.5

No additional fixes compared to 8.6.5alpha2

4.3.15 8.6.6

GE-7767 wrong accounting exit_status=52 if failed=52 due to
4.3.16 8.6.7alpha1

- GE-3271: Use syslog during the time where components would normally log into log files located in /tmp.
- GE-3687: Documentation for resource reservation needs to be more detailed.
- GE-4531: Explain in man qsub "-R" what the option does.
- GE-5301: Mention in documentation that client side JSV is not supported on native Windows (win-x86).
- GE-6160: qrstat should show ARs where user has access.
- GE-6179: Add a means to switch on and off debug logging (DPRINTF) of sge_execd during runtime.
- GE-6525: Document exit status (of intermediate accounting records) and failed field in reporting(5) and accounting(5).
- GE-6740: The configuration parser cannot handle white spaces before and after configuration values.
- GE-6809: Could not edit non reserved complex when advance reservation with pe is running.
- GE-6962: Put all remaining array job tasks into hold state instead of queue into E state.
- GE-7046: qstat -xml has xml syntax issue with qrsh in some specific case.
- GE-7421: Prevent win-x86 job processes from running away by working around the Windows Job Object race condition.
- GE-7484: RSMAP on global host breaks all RSMAPs.
- GE-7619: qhost, qstat,... -xml show wrong path to schemaLocation file.
- GE-7640: Queue instance stays in orphaned state forever after non-admin user forced job deletion.
- GE-7649: Collect information about CPU/GPU licensing.
- GE-7655: "qconf --sep --cb not ready for counts >= 100k.
- GE-7661: Query GPU count on every execd.
- GE-7662: Report GPU count on execd to qmaster.
- GE-7741: Add host_provider=<string> exed_param that allows Launch to tag cloud based execution nodes.
- GE-7759: drmaa2 error: smallest event number n is greater than number 1 i am waiting for.
- GE-7769: Provide transactional trigger to update host_aliases file.
- GE-7770: Ensure RHEL 8 support for UGE.
- GE-7801: Update info about cuda loadsensor in UGE documentation.
- GE-7814: Scan pci bus for Nvidia 3D controller if CUDA is not available.

UWSA-240 install_ugerest reports success even ugerest cannot start due to binding error

4.3.20  8.6.9

GE-6041 When adding a message (`-msg ""`) disabling all queue instances on a host only one instance has message, not all, as should be.
GE-6078 Messages stored for queue instances (`qmod -msg`) are not deleted when host is removed from queue
GE-7726 "context" in queue instance remains when queue message gets deleted or host removed from queue
GE-7957 Removing queue entries with "qconf -purge" not working for not resolveable hosts
GE-7991 Message applied to a group of qinstances during a state change is only assigned to qinstances of one cqueue
GE-8078 Optimize limit rule handling using ACLs
GE-8162 resource debiting issues cause poor cluster utilization
GE-8167 "qconf -purge" not working on "context" attribute
GE-8171 resource diagram should also contain the current state of all RSMAP ids
GE-8187 remove info logging about CUDA runtime library

4.3.21  8.6.10

GE-8194 UGE pseudo environment variables replacement not working for `qsub -e/-o`

4.3.22  8.6.11

GE-2218 Add new option -name to uidgid binary to return username
GE-3838 add "how to configure the Windows host" to the "Preparing Windows Hosts" section of the installation guide
GE-4257 In man page for sge_conf and sge_execd, correct/add load_report_time references
GE-4258 define the units of variables in sge_conf man page
GE-4458 allow specification of terabytes and petabytes for memory values
GE-5253 qmod -cj job exit with wrong status

Grid Engine Release Notes v 8.6.12
GE-5809 wrong error messages if RSMAP complex values are defined on queue level
GE-6041 When adding a message (-msg "") and disabling all queue instances on a host only one instance shows the message
GE-6078 Messages stored for queue instances (qmod -msg) are not deleted when host is removed from queue
GE-6844 analyze logging ""context" of "all.q" is empty - Adding new element(s)'.
GE-7030 XOR RSMAP request syntax rejected in JCs
GE-7274 memory usage values are negative on windows 7 and 10 hosts
GE-7287 event handler callback functions fail after QMaster restart
GE-7352 qalter -rdly prints wrong message if schedd_job_info is turned off
GE-7726 "context" in queue instance remains when queue message gets deleted or host removed from queue
GE-7763 allow UGE to work with unsupported new Docker versions
GE-7872 qalter and qmod job changes are not logged in reporting file
GE-7932 ability to suppress resolving/sending of additional group ids by client commands
GE-7950 qresub prints additional message to stdout
GE-7957 Removing queue entries with "qconf -purge" not working for not resolvable hosts
GE-7961 verify and improve the spoolling and spoolling-io profiling for classic spoolling
GE-7977 make warning time for host name resolving configurable
GE-7978 LOG_SPOOLING_TIME/LOG_REQUEST_PROCESSING time should always log as WARNING, document content
GE-7991 Message applied to a group of qinstances during a state change is only assigned to qinstances of one cqueue
GE-8010 wrong scheduling decisions with -masterl switch and max_reservation > 0
GE-8015 openmpi.template has wrong defaults
GE-8036 RQS "hosts" quotas not updated when hostgroups in a hostgroup are changed
GE-8037 enable schedd_runlog and debug tracing in Scheduler for a specific job only
GE-8044 do not resolve in clients UGE's additional group id's and defineable ranges
GE-8058 disable topology masks for RSMAPs on global host
GE-8060 sgemaster segfault on Ubuntu
GE-8070 pending array job with -hold_jid_ad dependency cannot be deleted
GE-8071 wrong or no reservation if all hosts/queues are blocked by an EXCL complex
GE-8073 enable schedd_runlog and debug tracing in Scheduler for a specific job only
GE-8078 Optimize limit rule handling using ACLs
GE-8089 sge_shadowd is restarted by SMF service on term signal
GE-8091 cleanup SMF module
GE-8103 requested resources are not freed after deleting a suspended job
GE-8126 resource debiting issues cause poor cluster utilization
GE-8156 event master does not handle lWhere filtering without lWhat setting
GE-8167 "qconf -purge" not working on "context" attribute
GE-8170 ensure UGE compatibility with DCGM versions up to 1.7.2
4.3.23 8.6.12

GE-7983 user share tree gives no tickets to jobs submitted in a project
GE-8087 incorrect scheduling/debiting of JOB consumables on global host
GE-8235 incorrect booking of resources in SRs
GE-8243 (implicit) -cal_jmp 0 ignored for SR creations
GE-8245 qrstat output issues
GE-8246 wrong timed_event thread error logging on AR rescheduling
GE-8247 qacct -q without -l request might report unexpected error logging
GE-8248 shepherd error on hosts with no suitable devices if cgroups parameter "device" is defined
GE-8253 modifying the end time of a standing reservation can lead to unavailable resources
5 Upgrade Notes

5.1 Upgrade Requirements

This is a summary of the Upgrade Matrix that describes how you can carry out the transition from Sun or Oracle Grid Engine 6.2uX, Univa Grid Engine 8.X.X to Univa Grid Engine 8.6 when you are currently using classic, BDB local spooling or PostgreSQL spooling.

<table>
<thead>
<tr>
<th>Version</th>
<th>Upgrade Method</th>

<td>Upgrade to SGE 6.2u5 and then Backup/Restore</td>
</tr>
</tbody>
</table>

Table 15: Upgrading from SGE, OGE, UGE 8.X.X to Univa Grid Engine 8.6.X
6 Compatibility Notes

6.1 Changes in Windows Execution Host sgepasswd File

The encryption algorithm for the "$SGE_ROOT/$SGE_CELL/common/sgepasswd" file passwords has been changed from RC4 to AES-256-CBC:

If you upgrade to the current version of Univa Grid Engine you need to convert your existing sgepasswd file during the upgrade procedure.

Become root and execute the following command on the master machine:

```
# sgepasswd -c
```

This will create a backup of your original 'sgepasswd' file as 'sgepasswd.old_algorithm_backup' and create the new compatible sgepasswd file. Otherwise encryption related error messages may show up.

If you create a new sgepasswd file from scratch no additional steps compared to previous versions are required.

6.2 Scheduler Log File

In previous versions of Univa Grid Engine if both the master and some slave tasks of a parallel job were scheduled to the same queue instance, one line was written to the scheduler log file containing the number of slots that was granted to this job on the queue instance of the master task. Such a line looked like this: 249:1:STARTING:1522328357:2772638938:Q:8@host1:slots:3.00000

From Univa Grid Engine 8.6.0 on, two lines are written, one for the master task, one for the slave tasks: 249:1:STARTING:1522328357:2772638938:Q:8@host1:slots:1.00000 249:1:STARTING:1522328357:2772638938:Q:8@host1:slots:2.00000

This is because of changed handling of the master task which was necessary to fix GE-5888, see the "Fixes and Enhancements" section for details.

6.3 Removed Scheduler-Parameter queue_sort_method

With the newly implemented affinity-feature, the scheduler-parameter queue_sort_method has been replaced with the new parameters weight_host_sort, weight_queue_host_sort, weight_queue_seqno. With these it is not only possible to configure a queue-sorting solely based on seq_no, or on the host_load_formula, as it was with queue_sort_method. But it is now also possible to configure a mixed sorting strategy, where the amount of the weight-parameters decide the ratio with which they influence the sorting.

For configuring what used to be queue_sort_method = load, one now has to set weight_queue_seqno to a significantly smaller number than weight_queue_host_sort. For queue_sort_method = seq_no, simply set weight_queue_seqno a significantly higher value than weight_queue_host_sort.
6.4 Changes for qconf Exit States

The qconf will no longer report an error when showing the content of empty configuration objects. If a configuration object contains no elements the exit status of qconf will be 0 and there will be no error message. The change affects following qconf command line options:

- qconf -scall show a list of all calendar names
- qconf -sckptl show all ckpt interface definitions
- qconf -sconfl show a list of all local configurations
- qconf -sel show a list of all exec servers
- qconf -sh show a list of all administrative hosts
- qconf -shrpl show host group list
- qconf -sjcl show job class list
- qconf -sm show a list of all managers
- qconf -so show a list of all operators
- qconf -spl show all parallel environments
- qconf -sprjl show a list of all projects
- qconf -sql show a list of all queues
- qconf -srgql show resource quota set list
- qconf -ss show a list of all submit hosts
- qconf -sul show a list of all userset lists
- qconf -suserl show a list of all users

6.5 Changes for Scheduler Profiling

The scheduler profiling option is revised and cleaned up. The most important changes are:

- Enhanced sge_diagnostics man page with info about scheduler profiling
- The scheduler profiling table shows new profiling levels: “ticket calculation”, “scheduler thread”, “ssos init”, “config update”, “wait for order completion”, “mirror events” and “set event client params”.
- The scheduler profiling level “pending ticket calculatio” was renamed to “priority calculation”.
- The scheduler profiling level “copy lists” was renamed to “data preparation”.
- The scheduler profiling level “scheduler” was renamed to “scheduling”.
- The scheduler profiling level “wait” was renamed to “waiting for events”.

6.6 Changed Limit Calculations

The resulting limit calculation is revised and fixed. The most important changes are:

- The configured consumable type (NO, YES, JOB, HOST) will have no influence on any resulting limit for tight integrated parallel jobs.
- Previous version calculated the resulting limits by far to high (depending on pe and consumable settings)
• This also affects the cgroups \texttt{h\_vmem} observation

Univa Grid Engine versions prior to 8.5.1 showed, by far, a to high limit value setting for limits like e.g. \texttt{h\_vmem}. The limit adjustments are now adapted. A detailed overview of the limit observation and how it works is described in the \texttt{sgediagnostics(1)} man page (JOB LIMITS).

ATTENTION: If you're updating to 8.6.0 from a previous version it is recommended to verify the used limit requests of your jobs. It might be necessary to change the request value. If the limit is set too low or adjusted to fit the old limit adjustment jobs which were running fine might fail after installing this version.

### 6.7 New Default for Job Verification of DRMAA Submitted Jobs

In the past a job verification (-w e) was triggered for all jobs submitted via DRMAA. This had a negative performance impact on qmaster for all DRMAA submitted jobs which might have had also a negative impact on the cluster throughput. The verification default for DRMAA jobs has now been disabled (-w n) for Univa Grid Engine 8.6.0. Users that nevertheless want to get jobs verified can still enable this through the DRMAA native specification.

### 6.8 Default for Integer Complexes

Older Univa Grid Engine installations allowed to request an integer complex resource during job submission without the need to specify the amount. Implicitly 1 was used when the amount of requested resources was omitted. This is not possible anymore beginning with 8.6.0.
6.9 Deprecated Functionality

`qalter -w p` is deprecated. Instead scheduler job information has to be used.
Starting with 8.6.5 `qmaster_param ENABLE_REDUCE_MEM_FREE` is deprecated and will be removed with 8.7.0. Decreasing and increasing of `mem_free` is now possible without any configuration.

6.10 Removed Functionality

Following components/features were removed with version 8.6.0 of Univa Grid Engine:

- Graphical Installer
- `qtcsh`

6.11 Changed UGERest configuration location

Starting with UGERest 8.6.4 the configuration files are installed into

```
$SGE_ROOT/$SGE_CELL/common/ugerest_conf.
```

This is done automatically when using `/install_ugerest` script for installation. The reason for this change was accidental overwriting of configuration files when unpacking a patch into an existing installation. If you still need your old configuration files for further reference to existing settings, backup the `$SGE_ROOT/ugerest/conf` directory before installing a new ugerest package file.

6.12 Changed UGERest restlet framework

With upgrade 8.6.11 the restlet framework version has changed from 2.3.12 to 2.4.2. This requires to run ugerest with JDK 1.8 or higher.

7 Known Issues and Limitations

None.
